

Tree Data Structure

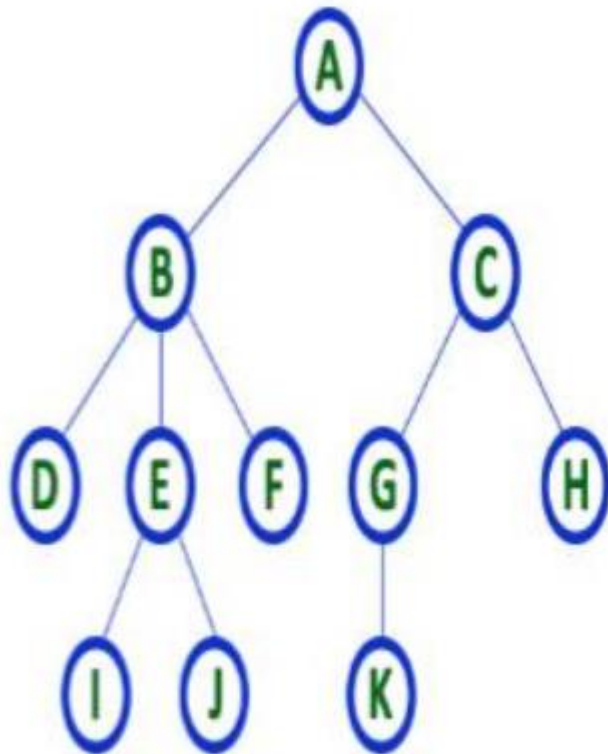

by

Dr. Nadia M. Mohammed

Tree data structure

- **Tree data structure** is a collection of data (Node) which is organized in hierarchical structure.
- In tree data structure, every individual element is called as **Node**.
- Node in a tree data structure, stores the actual data of that particular element and link to next element in hierarchical structure.
- In a tree data structure, if we have N number of nodes then we can have a maximum of $N-1$ number of links.

Example for tree data structure

TREE with 11 nodes and 10 edges

- In any tree with ' N ' nodes there will be maximum of ' $N-1$ ' edges
- In a tree every individual element is called as '**NODE**'

Tree Terminology

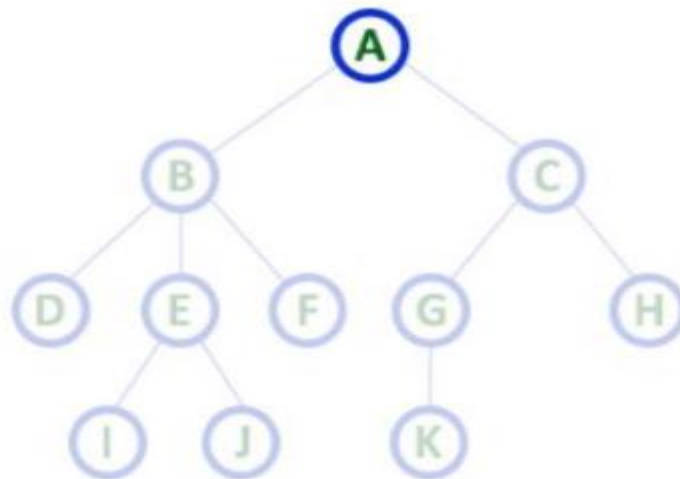

In a tree data structure, we use the following terminology.

1. Root

In a tree data structure, the first node is called as Root Node.

Every tree **must have root node**. In any tree, there **must be only one root node**.

Example

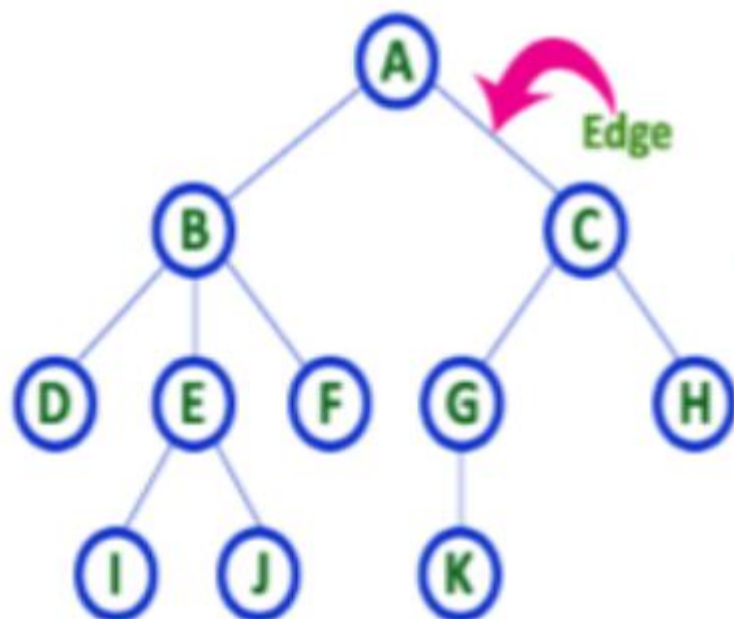

Here 'A' is the 'root' node

- In any tree the first node is called as ROOT node

2. Edge

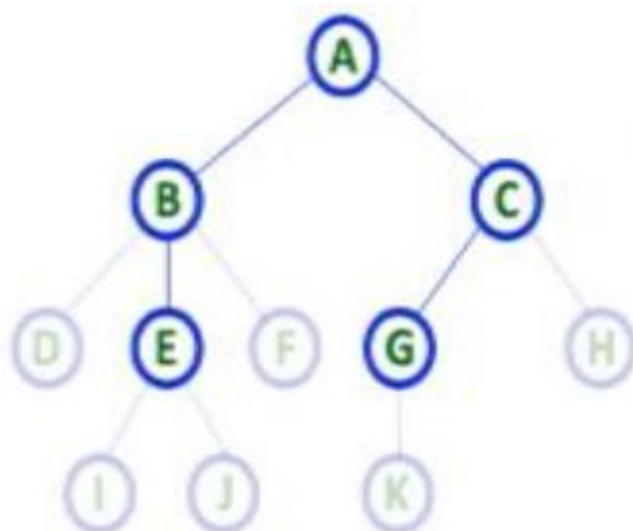

In a tree data structure, the connecting link between any two nodes is called as **EDGE**. In a tree with 'N' number of nodes there will be a maximum of 'N-1' number of edges.

- In any tree, 'Edge' is a connecting link between two nodes.

3. Parent

In a tree data structure, the node which is predecessor of any node is called as **PARENT NODE**. In simple words, the node which has branch from it to any other node is called as parent node. Parent node can also be defined as "**The node which has child / children**".

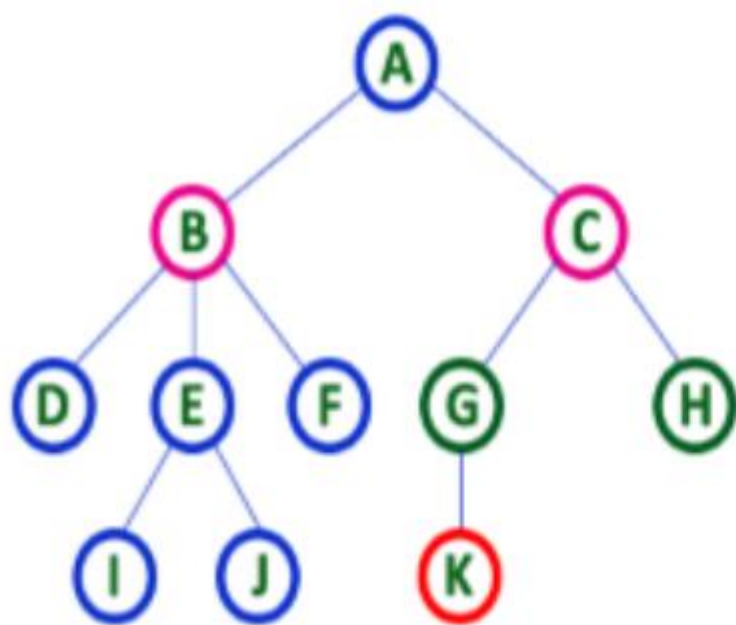

Here A, B, C, E & G are **Parent** nodes

- In any tree the node which has child / children is called '**Parent**'
- A node which is predecessor of any other node is called '**Parent**'

4. Child

In a tree data structure, the node which is descendant of any node is called as **CHILD Node**. In simple words, the node which has a link from its parent node is called as child node. In a tree, any parent node can have any number of child nodes. In a tree, all the nodes except root are child nodes.

Here B & C are Children of A

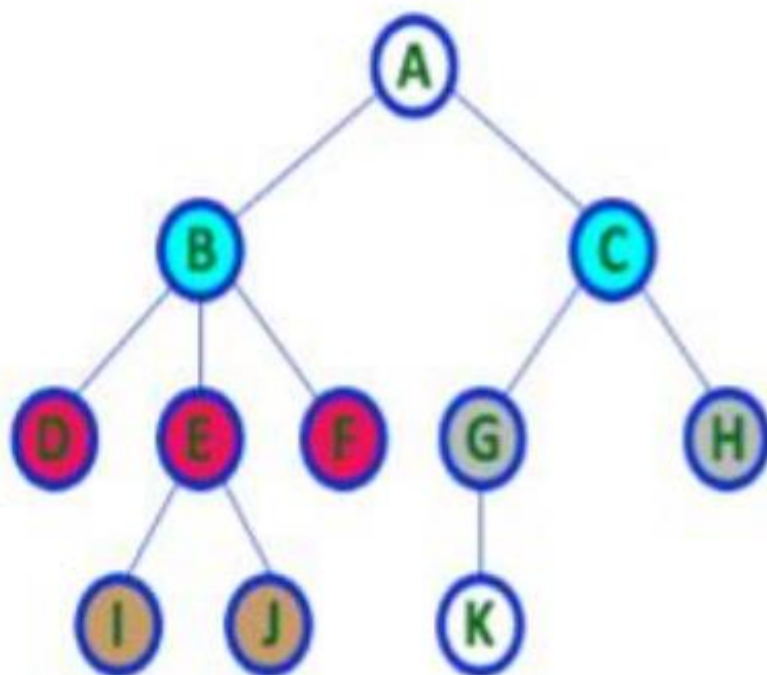

Here G & H are Children of C

Here K is Child of G

- descendant of any node is called as CHILD Node

5. Siblings

In a tree data structure, nodes which belong to same Parent are called as **SIBLINGS**.
In simple words, the nodes with same parent are called as Sibling nodes.

Here **B & C** are **Siblings**

Here **D E & F** are **Siblings**

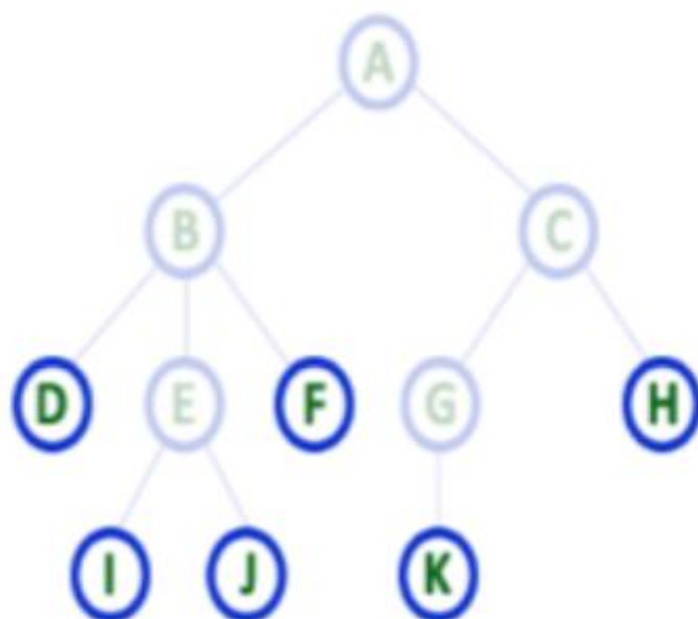

Here **G & H** are **Siblings**

Here **I & J** are **Siblings**

- In any tree the nodes which has same Parent are called '**Siblings**'
- The children of a Parent are called '**Siblings**'

6. Leaf

In a tree data structure, the node which does not have a child is called as **LEAF Node**. In simple words, a leaf is a node with no child. In a tree data structure, the leaf nodes are also called as **External Nodes**. External node is also a node with no child. In a tree, leaf node is also called as 'Terminal' node.

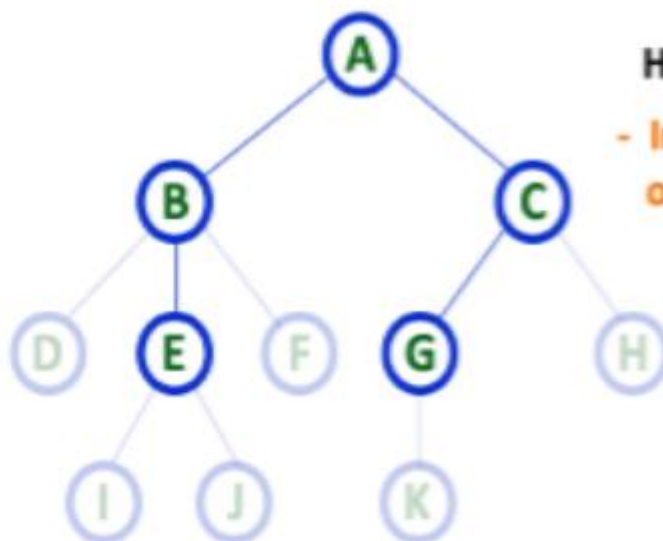

Here D, I, J, F, K & H are **Leaf** nodes

- In any tree the node which does not have children is called '**Leaf**'
- A node without successors is called a '**leaf**' node

7. Internal Nodes

In a tree data structure, the node which has at least one child is called as **INTERNAL Node**. In simple words, an internal node is a node with at least one child. In a tree data structure, nodes other than leaf nodes are called as **Internal Nodes**. The

root node is also said to be Internal Node if the tree has more than one node. Internal nodes are also called as 'Non-Terminal' nodes.

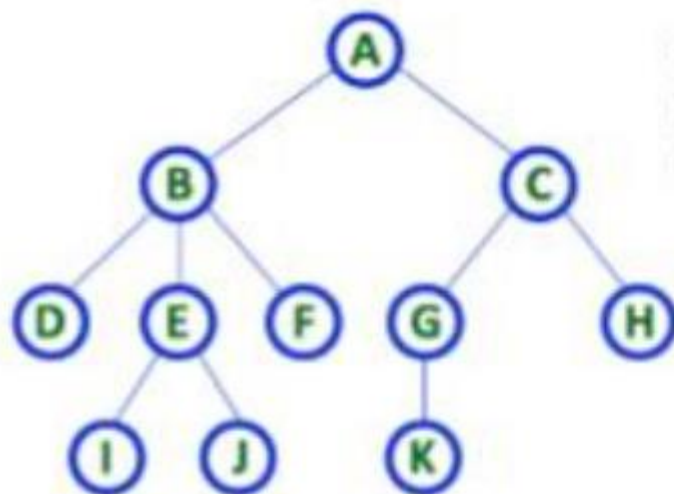

Here A, B, C, E & G are **Internal** nodes

- In any tree the node which has atleast one child is called '**Internal**' node

- Every non-leaf node is called as '**Internal**' node

8. Degree

In a tree data structure, the total number of children of a node is called as **DEGREE** of that Node. In simple words, the Degree of a node is total number of children it has. The highest degree of a node among all the nodes in a tree is called as 'Degree of Tree'

Here Degree of B is 3

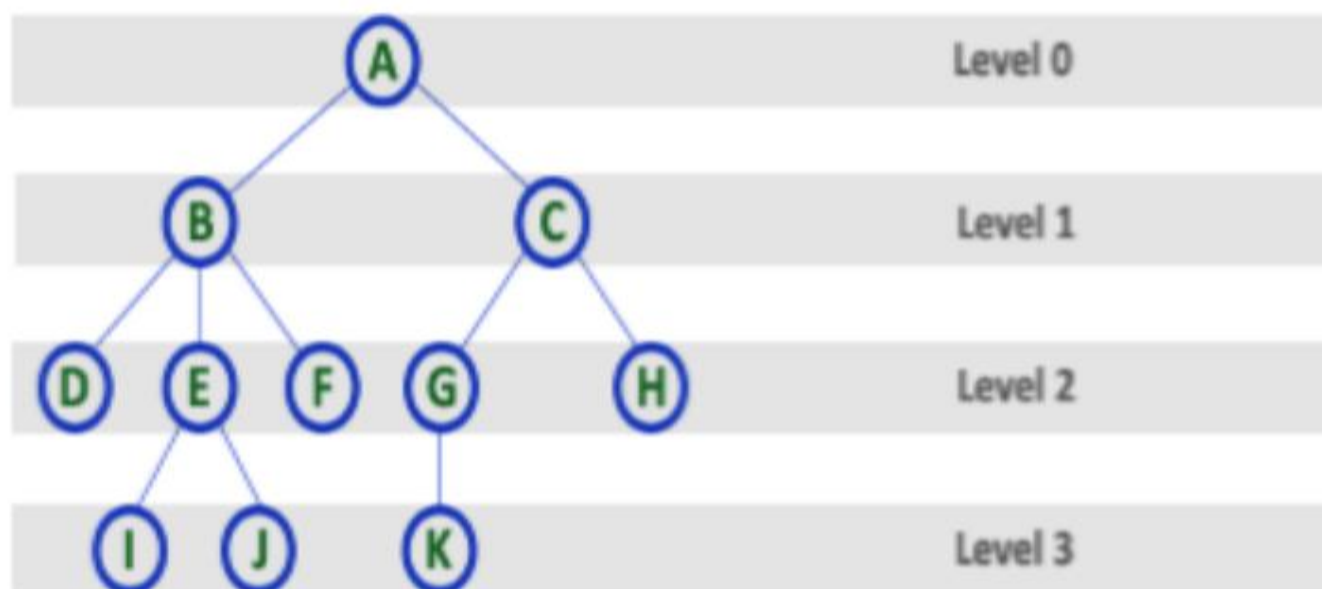

Here Degree of A is 2

Here Degree of F is 0

- In any tree, 'Degree' a node is total number of children it has.

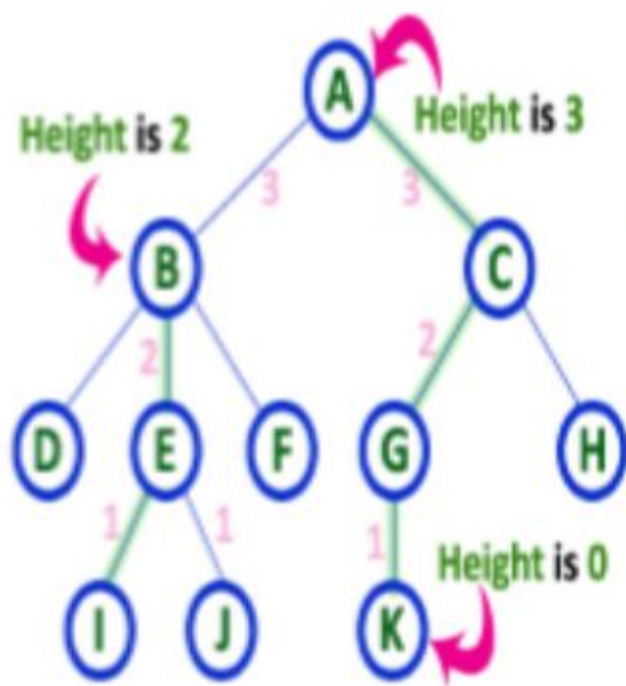

9. Level

In a tree data structure, the root node is said to be at Level 0 and the children of root node are at Level 1 and the children of the nodes which are at Level 1 will be at Level 2 and so on... In simple words, in a tree each step from top to bottom is called as a Level and the Level count starts with '0' and incremented by one at each level (Step).

10. Height

In a tree data structure, the total number of edges from leaf node to a particular node in the longest path is called as **HEIGHT** of that Node. In a tree, height of the root node is said to be height of the tree. In a tree, height of all leaf nodes is '0'.

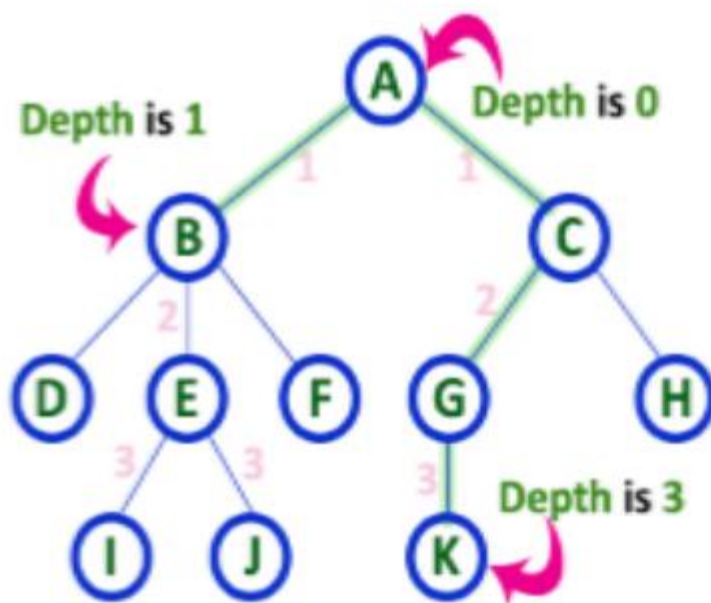

Here Height of tree is 3

- In any tree, 'Height of Node' is total number of Edges from leaf to that node in longest path.
- In any tree, 'Height of Tree' is the height of the root node.

11. Depth

In a tree data structure, the total number of edges from root node to a particular node is called as **DEPTH** of that Node. In a tree, the total number of edges from root node to a leaf node in the longest path is said to be **Depth of the tree**. In simple words, the

highest depth of any leaf node in a tree is said to be depth of that tree. In a tree, **depth of the root node is '0'**.

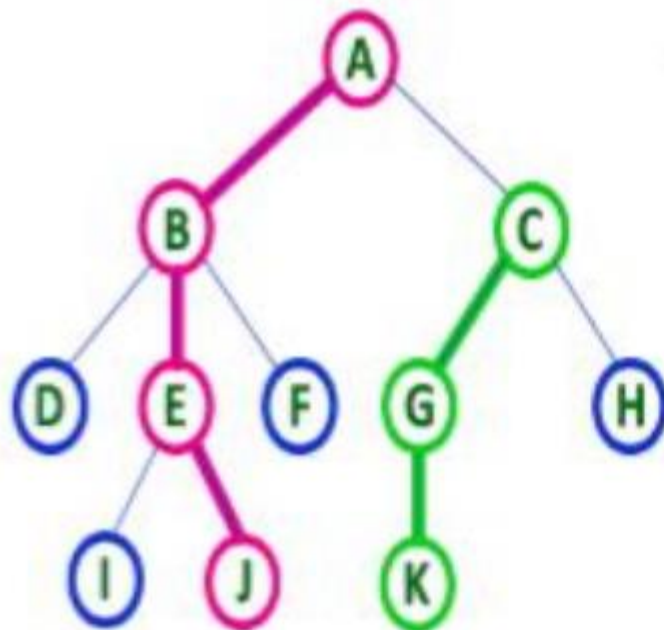

Here Depth of tree is 3

- In any tree, 'Depth of Node' is total number of Edges from root to that node.
- In any tree, 'Depth of Tree' is total number of edges from root to leaf in the longest path.

12. Path

In a tree data structure, the sequence of Nodes and Edges from one node to another node is called as **PATH** between that two Nodes. Length of a Path is total number of nodes in that path. In below example the path A - B - E - J has length 4.

- In any tree, 'Path' is a sequence of nodes and edges between two nodes.

Here, 'Path' between A & J is

A - B - E - J

Here, 'Path' between C & K is

C - G - K

13. Sub Tree

In a tree data structure, each child from a node forms a subtree recursively. Every child node will form a subtree on its parent node.
