Lecture 2: LR Parser Family

BY: Assist Prof. Dr. Ielaf O Abdul Majjed

Class code

hoyjoow []

The LR(k) parsing technique was introduced by Knuth in 1965

L is for Left-to-right scanning of input, R corresponds to a Rightmost derivation done in reverse, and k is the number of lookahead symbols used to make parsing decisions.

There are three widely used Algorithms available for constructing an LR parser:

SLR (1) – Simple LR Parser.

LR (1) – LR Parser.

LALR (1) – Look-Ahead LR Parser

Rules for LR parser:

The rules of LR parser as follows:

- ✚ The first item from the given grammar rules adds itself as the first closed set.
- ✚ If an object is present in the closure of the form $A \rightarrow \alpha. \beta. \gamma$, where the next symbol after the symbol is non-terminal, add the symbol's production rules where the dot precedes the first item.
- ✚ Repeat steps (B) and (C) for new items added under (B).

The LR-Parsing Algorithm

A schematic of an LR parser consists of an *input*, an *output*, a *stack*, a *driver program*, and a *parsing table* that has two parts (ACTION and GOTO).

- The driver program is the same for all LR parsers; only the **parsing table** changes from one parser to another.
- The parsing program reads characters from an **input buffer** one at a time.
- Where a shift-reduce parser would **shift a symbol**, an LR parser shifts a state.
- Each state summarizes the information contained in the **stack** below it.

Parsing Table:

Parsing table is divided into two parts- **Action table and Go-To table**. The action table gives a grammar rule to implement the given current state and current terminal in the input stream.

1. The **ACTION function** takes as arguments a state i and a terminal a (or $\$$, the input endmarker).

The value of ACTION $[i, a]$ can have one of four forms:

- Shift j , where j is a state : The action taken by the parser effectively shifts input a to the stack, but uses state j to represent a .
- Reduce $A \beta$. The action of the parser effectively reduces β on the top of the stack to head A .
- Accept. The parser accepts the input and finishes parsing.
- Error. The parser discovers an error in its input and takes some corrective action.

2. We extend the **GOTO function**, defined on sets of items, to states:

if $\text{GOTO} [I_i, A] = I_j$, then GOTO also maps a state i and a nonterminal A to state j

Example: For the following grammar, the LR-parsing table's **ACTION** and **GOTO** functions are as follows:

$E \rightarrow E + T \mid T$
 $T \rightarrow T * F \mid F$
 $F \rightarrow (E) \mid \text{id}$

Repeated with the productions numbered

1. $E \rightarrow E + T$

2. $E \rightarrow T$

3. $T \rightarrow T * F$

4. $T \rightarrow F$

5. $F \rightarrow (E)$

6. $F \rightarrow id$

The codes for the actions are:

1. *si* means **shift** and stack state *i*,

2. *rj* means **reduce** by the production numbered *j*,

3. *acc* means **accept**,

4. *blank* means **error**.

First construct the set of items **I0**:

I0:

$E \rightarrow \bullet E + T$ r1

$E \rightarrow \bullet T$ r2

$T \rightarrow \bullet T * F$ r3

$T \rightarrow \bullet F$ r4

$F \rightarrow \bullet (E)$ r5

$F \rightarrow \bullet id$ r6

I1: Goto [**I0**, E]

$E \rightarrow E \bullet + T \dots$ **Accept**

I2: Goto [**I0**, T]

$E \rightarrow T \bullet \dots$ **Complete**

$T \rightarrow T \bullet * F$

I3: Goto [**I0**, F]

$T \rightarrow F \bullet$

I4: Goto [**I0**, (]

$F \rightarrow (\bullet E)$

$E \rightarrow \bullet E + T$

$E \rightarrow \bullet T$

$T \rightarrow \bullet T * F$

$T \rightarrow \bullet F$

$F \rightarrow \bullet (E)$

$F \rightarrow \bullet id$

I5: Goto [**I0**, id]

F \rightarrow id \bullet ... **Complete**

I6: Goto [**I1**, +]

E \rightarrow E \bullet + **T**

T \rightarrow \bullet T * **F**

T \rightarrow \bullet **F**

F \rightarrow \bullet (**E**)

F \rightarrow \bullet id

I7: Goto [**I2**, *]

T \rightarrow T * \bullet **F**

F \rightarrow \bullet (**E**)

F \rightarrow \bullet id

I8: Goto [**I4**, E]

F \rightarrow (**E** \bullet)

E \rightarrow E \bullet + **T**

Goto [**I4**, T] = **I2** قررکم تلااح

Goto [**I4**, F] = **I3**

Goto [**I4**, (] = **I4**

Goto [**I4**, id] = **I5**

I9: Goto [I6, T]

E \rightarrow E + T • ... **Complete**

Goto [I6, T] = I2

Goto [I6, F] = I3

Goto [I6, (] = I4

Goto [I6, id] = I5

I10: Goto [I7, F]

T \rightarrow T * F • ... **Complete**

Goto [I7, (] = I4

Goto [I7, id] = I5

I11: Goto [I8,)]

F \rightarrow (E) • ... **Complete**

Follow(E) = { \$, +,) }

Follow(T) = { \$, +,), * }

Follow(F) = { \$, +,), * }

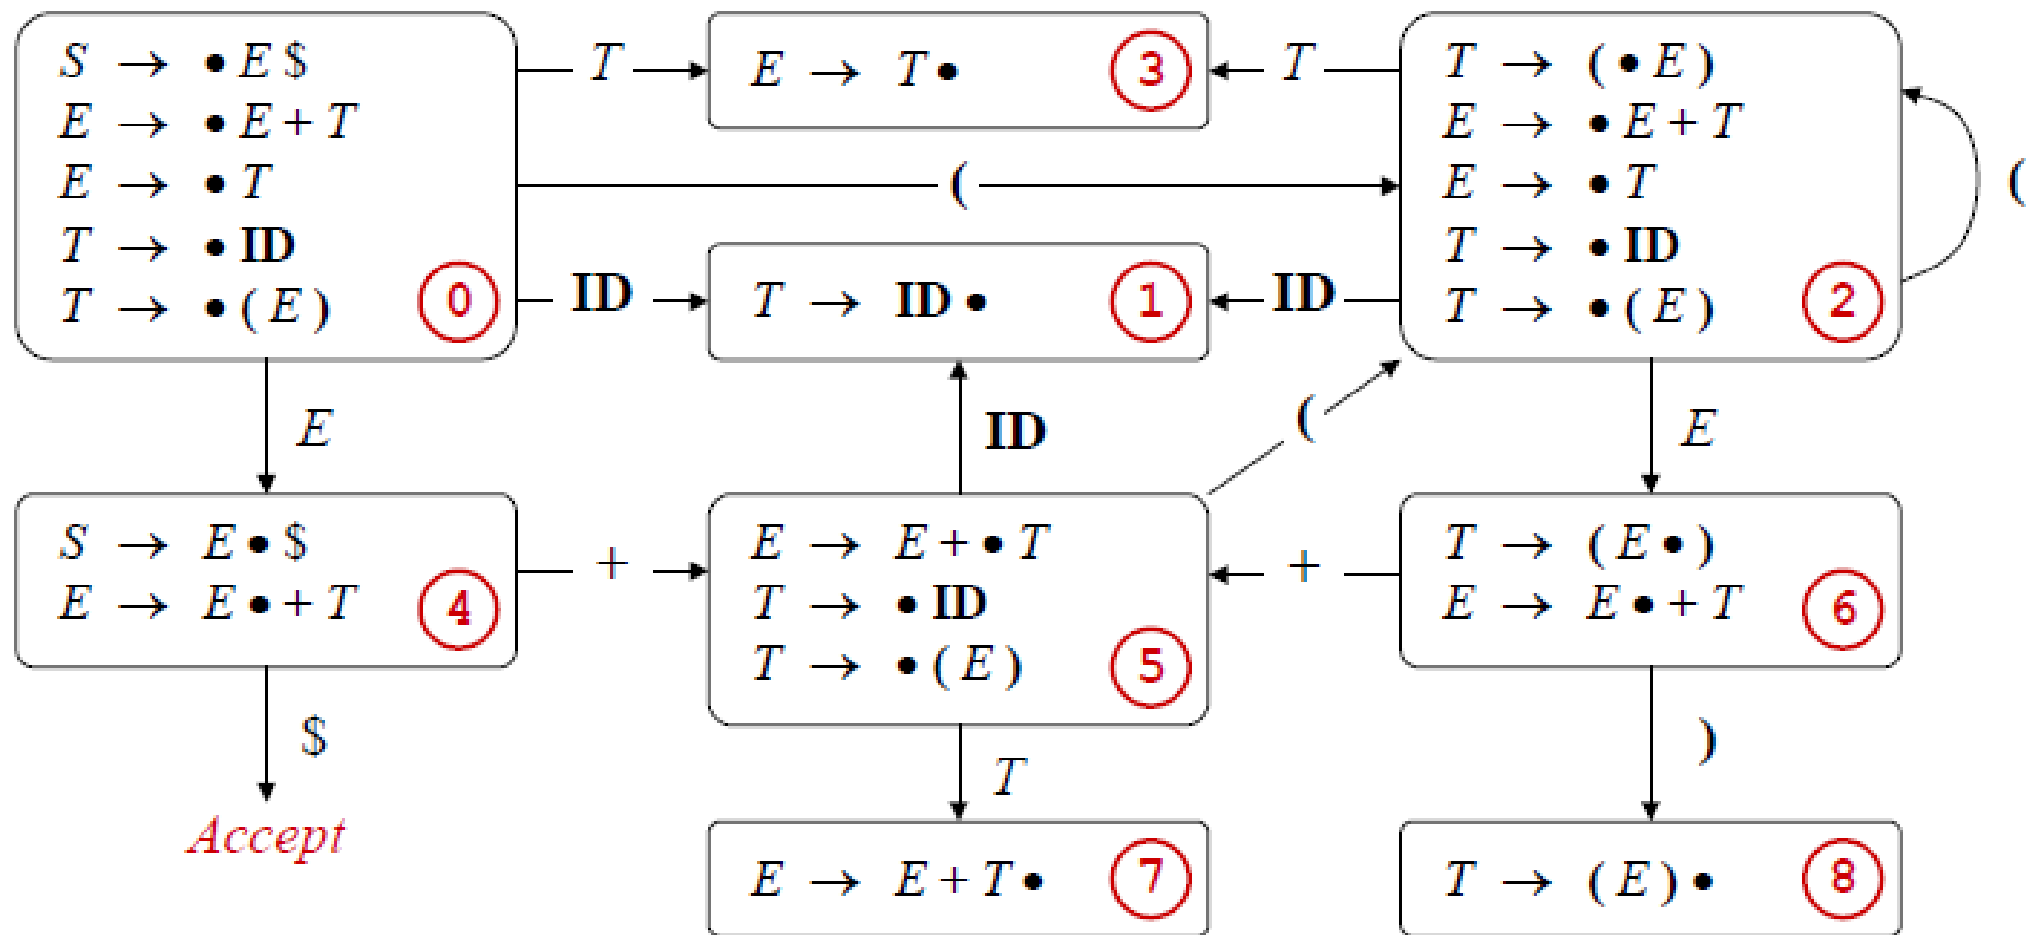

1. $E \rightarrow E + T$
2. $E \rightarrow T$
3. $T \rightarrow T * F$
4. $T \rightarrow F$
5. $F \rightarrow (E)$
6. $F \rightarrow id$

LR Parser Table:

| Stack | Input Symbols | Output |
|--------------------|-------------------|------------------------------|
| 0 | $id * id + id \$$ | Shift |
| 0 id 5 | $* id + id \$$ | Reduce $F \rightarrow id$ |
| 0 F 3 | $* id + id \$$ | Reduce $T \rightarrow F$ |
| 0 T 2 | $* id + id \$$ | Shift |
| 0 T 2 * 7 | $id + id \$$ | Shift |
| 0 T 2 * 7 id 5 | $+ id \$$ | Reduce $F \rightarrow id$ |
| 0 T 2 * 7 F 10 | $+ id \$$ | Reduce $T \rightarrow T * F$ |
| 0 T 2 | $+ id \$$ | Reduce $E \rightarrow T$ |
| 0 E 1 | $+ id \$$ | Shift |
| 0 E 1 + 6 | $id \$$ | Shift |
| 0 E 1 + 6 id 5 | $\$$ | Reduce $F \rightarrow id$ |
| 0 E 1 + 6 F 3 | $\$$ | Reduce $T \rightarrow F$ |
| 0 E 1 + 6 T 9 | $\$$ | Reduce $E \rightarrow E + T$ |
| 0 E 1 | $\$$ | Accept |

| | Action | | | | | | Goto | | |

Example 2

Constructing SLR-Parsing Tables

We shall refer to the parsing table constructed by this method as an SLR table, and to an LR parser using an SLR-parsing table as an SLR parser.

The other two methods augment the SLR method with lookahead information.

The ***action*** and ***goto*** entries in the parsing table are then constructed using the following algorithm. It requires us to know FOLLOW(A) for each nonterminal A of a grammar.

Constructing an SLR-parsing table Algorithm:

INPUT: An augmented grammar G' .

OUTPUT: The SLR-parsing table functions ACTION and COTO for G' .

METHOD:

1. Construct $C = \{I_0, I_1, \dots, I_n\}$, the collection of sets of LR(0) items for G' .

2. State i is constructed from I_i .

The parsing actions for state i are determined as follows:

- If $[A \rightarrow \alpha.\alpha\beta]$ is in I_i and $\text{GOTO}(I_i, \alpha) = I_j$, then set $\text{ACTION}[i, \alpha]$ to "**shift j**." Here α must be a terminal.
- If $[A \rightarrow \alpha.]$ is in I_i , then set $\text{ACTION}[i, \alpha]$ to "**reduce** $A \rightarrow \alpha$ " for all α in $\text{FOLLOW}(A)$; here A may not be S' .
- if $[S' \rightarrow S.]$ is in I_i , then set $\text{ACTION}[i, S]$ to "**accept**." If any conflicting actions result from the above rules, we say the grammar is not SLR (1). The algorithm fails to produce a parser in this case.

3. The goto transitions for state i are constructed for all nonterminals A using the rule: If $\text{GOTO}(I_i, A) = I_j$, then $\text{GOTO}[i, A] = j$.

4. All entries not defined by rules (2) and (3) are made "**error**."

5. The initial state of the parser is the one constructed from the set of items containing $[S' \rightarrow .S]$.

Example:

Let us construct the **SLR** table for the **augmented** expression grammar. The canonical collection of sets of **LR**(0) items for the grammar.

I_0 :

| | | |
|------------------|-----------------|----|
| $E' \rightarrow$ | $\bullet E$ | r1 |
| $E \rightarrow$ | $\bullet E + T$ | r2 |
| $E \rightarrow$ | $\bullet T$ | r3 |
| $T \rightarrow$ | $\bullet T * F$ | r4 |
| $T \rightarrow$ | $\bullet F$ | r5 |
| $F \rightarrow$ | $\bullet (E)$ | r6 |
| $F \rightarrow$ | $\bullet id$ | r7 |

I1: Goto [**I0**, E]

$E' \rightarrow E \bullet \dots$ **Accept**

$E \rightarrow E \bullet + T$

I2: Goto [**I0**, T]

$E \rightarrow T \bullet \dots$ **Complete**

$T \rightarrow T \bullet * F$

I3: Goto [**I0**, F]

$T \rightarrow F \bullet \dots$ **Complete**

I4: Goto [**I0**, (]

$F \rightarrow (\bullet E)$

$E \rightarrow \bullet E + T$

$E \rightarrow \bullet T$

$T \rightarrow \bullet T * F$

$T \rightarrow \bullet F$

$F \rightarrow \bullet (E)$

$F \rightarrow \bullet id$

I5: Goto [**I0**, id]

F \rightarrow id • ... Complete

I6: Goto [**I1**, +]

E \rightarrow E + • T

T \rightarrow • T * F

T \rightarrow • F

F \rightarrow • (E)

F \rightarrow • id

I7: Goto [**I2**, *]

T \rightarrow T * • F

F \rightarrow • (E)

F \rightarrow • id

I8: Goto [**I4**, *]

F \rightarrow (E •)

Goto [**I4**, E] = **I1**

Goto [**I4**, T] = **I2**

Goto [**I4**, F] = **I3**

Goto [**I4**, (] = **I4**

Goto [**I4**, id] = **I5**

I9: Goto [**I6**, T]

E \rightarrow **E** + **T**• ... Complete

Goto [**I6**, T] = **I2**

Goto [**I6**, F] = **I3**

Goto [**I6**, (] = **I4**

Goto [**I6**, id] = **I5**

I10: Goto [**I7**, F]

T \rightarrow **T** * **F**• ... Complete

Goto [**I7**, (] = **I4**

Goto [**I7**, id] = **I5**

I11: Goto [**I8**,)]

F \rightarrow (**E**)• ... Complete

Follow(E) = {**\$**, +,)}

Follow(T) = {**\$**, +,), *}

Follow(F) = {**\$**, +,), *}

SLR-Parsing Tables:

| State | Action | | | | | | Goto | | |
|-------|--------|----|----|----|-----|--------|------|---|----|
| | id | + | * | (|) | \$ | E | T | F |
| 0 | s5 | | | s4 | | | 1 | 2 | 3 |
| 1 | | s6 | | | | Accept | | | |
| 2 | | r2 | s7 | | r2 | r2 | | | |
| 3 | | r4 | r4 | | r4 | r4 | | | |
| 4 | s5 | | | s4 | | | 8 | 2 | 3 |
| 5 | | r6 | r6 | | r6 | r6 | | | |
| 6 | s5 | | | s4 | | | | 9 | 3 |
| 7 | s5 | | | s4 | | | | | 10 |
| 8 | | s6 | | | s11 | | | | |
| 9 | | r1 | s7 | | r1 | r1 | | | |
| 10 | | r3 | r3 | | r3 | r3 | | | |
| 11 | | r5 | r5 | | r5 | r5 | | | |
