

## FIRST LECTURE

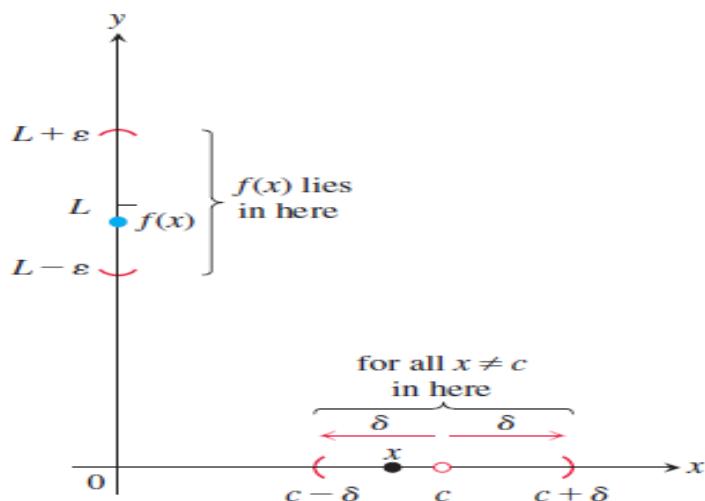

# Limits and Theory of Derivative

## The Limits

**Definition:** If  $f$  be a function defined at each point of some interval containing  $a$ , except possibly at itself. Then a number  $L$  is the limit of  $f(x)$  as  $x$  approaches  $a$  (or is the limit of  $f$  at  $a$ ) if for every number  $\varepsilon > 0$  there is a number  $\delta > 0$  such that If

$$0 < |x - a| < \delta, \text{ then } |f(x) - L| < \varepsilon$$

تعريف: اذا كانت الدالة معرفة عند كل نقطة في الفترة التي تضم النقطة  $a$  ، ربما ليست معرفة عند النقطة .  $a$  فالعدد  $L$  هو غاية الدالة  $f(x)$  عندما  $x$  تقترب من  $a$  يوجد لكل عدد

If  $L$  is the limit of  $f(x)$  as  $x$  approaches  $a$ , then we write

$$\lim_{x \rightarrow a} f(x) = L$$

If such an  $L$  can be found, then we say that the limit of  $f$  at  $a$  exists, or that  $f$  has a limit at  $a$ , or that  $\lim_{x \rightarrow a} f(x)$  exists. (The limit of the function  $f$  at  $a$  unique)

إذاً امكن ايجاد غاية قيمتها  $L$  ، سوف نقول ان غاية الدالة موجودة، او الدالة لها غاية عندما الغاية تقترب من العدد  $a$ . (الغاية للدالة عند العدد  $a$  تكون وحيدة).

## One sided limit

If the values of  $f(x)$  can be made as close as we like to  $L$  by taking values of  $x$  sufficiently close to  $a$  (but greater than  $a$ ), then we write

$$\lim_{x \rightarrow a^+} f(x) = L$$

Similarly, If the values of  $f(x)$  can be made as close as we like to  $L$  by taking values of  $x$  sufficiently close to  $a$  (but less than  $a$ ), then we write

$$\lim_{x \rightarrow a^-} f(x) = L$$

**Note:** we say that the functions have limits

$$\lim_{x \rightarrow a} f(x) = L, \text{ if and only if } \lim_{x \rightarrow a^+} f(x) = L = \lim_{x \rightarrow a^-} f(x)$$

### **Theorem (Limit Law):**

If  $L, M, c$ , and  $k$  are real numbers and

$$\lim_{x \rightarrow c} f(x) = L \quad \text{and} \quad \lim_{x \rightarrow c} g(x) = M, \quad \text{then}$$

1. *Sum Rule:*  $\lim_{x \rightarrow c} (f(x) + g(x)) = L + M$

2. *Difference Rule:*  $\lim_{x \rightarrow c} (f(x) - g(x)) = L - M$

3. *Constant Multiple Rule:*  $\lim_{x \rightarrow c} (k \cdot f(x)) = k \cdot L$

4. *Product Rule:*  $\lim_{x \rightarrow c} (f(x) \cdot g(x)) = L \cdot M$

5. *Quotient Rule:*  $\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = \frac{L}{M}, \quad M \neq 0$

6. *Power Rule:*  $\lim_{x \rightarrow c} [f(x)]^n = L^n, \quad n \text{ a positive integer}$

7. *Root Rule:*  $\lim_{x \rightarrow c} \sqrt[n]{f(x)} = \sqrt[n]{L} = L^{1/n}, \quad n \text{ a positive integer}$

### Examples: -

#### a) Evaluate the limitations for the following functions:

$$1) \lim_{x \rightarrow 0} (x^2 + 3x - 1) = (0^2 + 3(0) - 1) = -1$$

$$2) \lim_{x \rightarrow -1} \left( \frac{x^3 - 2x^2 - 3x + 4}{x^2 - 5x - 5} \right) = \frac{(-1)^3 - 2(-1)^2 - 3(-1) + 4}{(-1)^2 - 5(-1) - 5} = \frac{-1 - 2 + 3 + 4}{1 + 5 - 5} = 4$$

$$3) \lim_{x \rightarrow -2} (\sqrt{4x^2 - 3}) = \sqrt{4(-2)^2 - 3} = \sqrt{13}$$

$$4) \lim_{x \rightarrow -2} (|x| + 3) = |-2| + 3 = 2 + 3 = 5$$

#### b) Evaluate the following limits:

$$1) \lim_{x \rightarrow 1} \frac{1}{x-1}$$

We cannot substitute  $x = 1$ , because it makes the denominator zero. So, we are to test the limits from the two sided of this function.

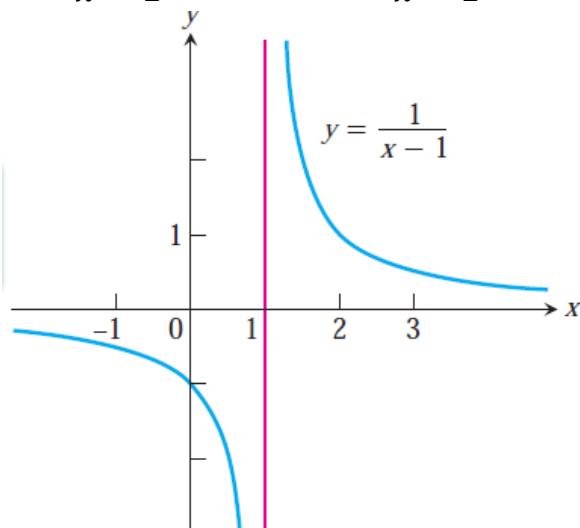

لاحظ اننا لانستطيع نعوض في الغاية مباشرة، وذلك لا المقام سوف تصبح قيمته صفر. ولهذا علينا ان نختبر الغاية من الطرفين.

$$\Rightarrow \lim_{x \rightarrow 1^-} \frac{1}{x-1} = -\infty, \lim_{x \rightarrow 1^+} \frac{1}{x-1} = +\infty$$

This function is **one-sided limits**, but no limits of this function, because the value of  $f(x)$  do not approach a single number as  $x \rightarrow 1$ .

هذه الدالة تملك غاية من جهة وذلك لأن الغاية من الجهةين مختلفتين (الغاية ليست وحيدة).

$$i.e \lim_{x \rightarrow 1^-} \frac{1}{x-1} = -\infty \neq \lim_{x \rightarrow 1^+} \frac{1}{x-1} = +\infty$$

2)  $\lim_{x \rightarrow 1} \left( \frac{x^2+x-2}{x^2-x} \right)$

We cannot substitute  $x = 1$  because it makes the denominator zero. We test the numerator to see if it, too, is zero at  $x = 1$ . It is, so it has a factor of  $(x - 1)$  in common with the denominator. Canceling this common factor gives a simpler fraction with the same values as the original for  $x \neq 1$ .

$$\Rightarrow \lim_{x \rightarrow 1} \left( \frac{x^2+x-2}{x^2-x} \right) = \lim_{x \rightarrow 1} \left( \frac{(x-1)(x+2)}{x(x-1)} \right) = \lim_{x \rightarrow 1} \left( \frac{(x+2)}{x} \right) = \frac{(1+2)}{1} = 3$$

3)  $\lim_{x \rightarrow 0} \left( \frac{|x|}{x} \right)$

We cannot substitute  $x = 0$  because it makes the denominator zero. So, we are to test the limits from the two sided of this function, by the definition of  $|x|$ , we have

$$\lim_{x \rightarrow 0^-} \left( \frac{|x|}{x} \right) = \lim_{x \rightarrow 0^-} \left( \frac{-x}{x} \right) = -1, \quad \lim_{x \rightarrow 0^+} \left( \frac{|x|}{x} \right) = \lim_{x \rightarrow 0^+} \left( \frac{x}{x} \right) = 1$$

This function is one-sided limits, but no limits of this function, because the value of  $f(x)$  do not approach a single number as  $x \rightarrow 0$ . i.e.

$$\lim_{x \rightarrow 0^-} \left( \frac{-x}{x} \right) = -1 \neq \lim_{x \rightarrow 0^+} \left( \frac{x}{x} \right) = 1$$

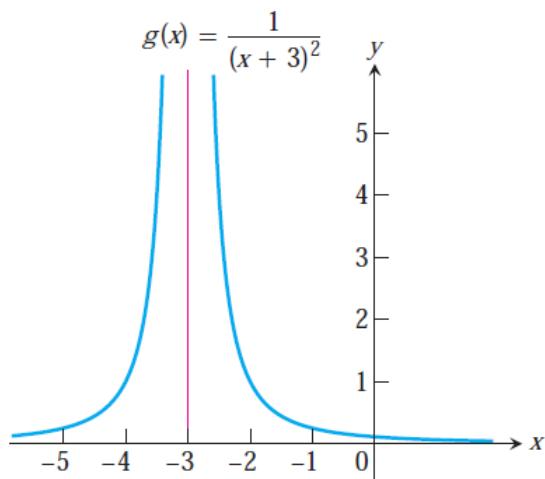

4)  $\lim_{x \rightarrow -3} \left( \frac{1}{(x+3)^2} \right) = +\infty$

We can verify our solution is correct or not, we are to take the limits for both sided at  $x = 3$ . We are going to solve it as the above example, so we cannot substitute  $x = 3$  because it makes the denominator zero. So, we are to test the limits from the two sided of this function.

$$\lim_{x \rightarrow -3^+} \left( \frac{1}{(x+3)^2} \right) = +\infty, \quad \lim_{x \rightarrow -3^-} \left( \frac{1}{(x+3)^2} \right) = +\infty$$

Since the limits of both sided are equal, so the function has limit at  $x = 4$ .

$$\lim_{x \rightarrow -3^+} \left( \frac{1}{(x+3)^2} \right) = +\infty = \lim_{x \rightarrow -3^-} \left( \frac{1}{(x+3)^2} \right)$$

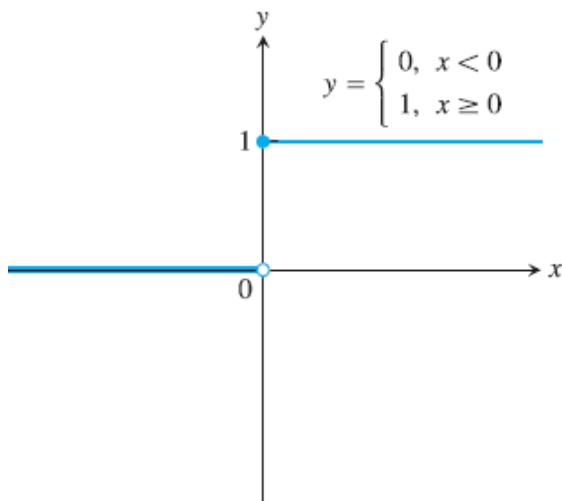

5) Find the limit for the function  $f(x) = \begin{cases} 0, & \text{if } x < 0 \\ 1, & \text{if } x \geq 0 \end{cases}$

We know that  $\lim_{x \rightarrow 0^-} f(x) = 0$ , because  $\lim_{x \rightarrow 0^-} 0 = 0$ .

Similarly,  $\lim_{x \rightarrow 0^+} f(x) = 1$ , because  $\lim_{x \rightarrow 0^+} 1 = 1$ .

Since the limits of both sides are equal, so the function has limit at  $x = 0$ , thus both one sided limit exists, and they are unequal. Therefore,  $f$  has no two-sided limit at **0 (has no limit)**.

# The Theory of Derivative

**Definition:** Suppose that  $x_0$  is a number in the domain of the function  $f$ . If

$$\lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

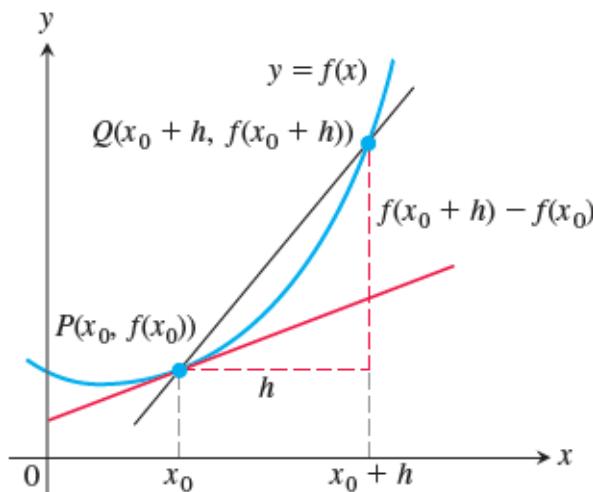

Then the value of this **limit** is called **the derivative of  $f$  at  $x = x_0$** , and is denoted by  $(\dot{f}(x), \dot{y}, \frac{dy}{dx}, D_x y)$ .

i.e.,

$$\dot{f}(x) = \lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

This called **(The Mathematical Definition for Derivative)**

**Note:** we can replace  $h$  by  $\Delta x$ , [ $\Delta x = (x_0 + h) - x_0$ ]

**Definition:** The **slope (ميل)** of the  $y = f(x)$  at the point  $p(x_0, f(x_0))$  is the number

$$\dot{f}(x) = \lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h}$$

The **tangent line (خط المماس)** to the curve at  $p$  is the line through  $p$  with this slope. The equation of the tangent line is:  $y - f(x_0) = \dot{f}(x_0)(x - x_0)$ .

## ***Examples:***

**خطوات الحل:**

نكتب القانون العام للاشتغال

$$\hat{f}(x) = \lim_{h \rightarrow 0} \frac{f(x_0+h)-f(x_0)}{h}$$

نجد مائلی:

(a) تعطى  $f(x)$  في السؤال.

(b) نجد  $f(x_0 + h)$  وذلك بتحويل كل  $x$  موجودة في الدالة الاصلية الى  $(x_0 + h)$  ثم نعرض بالقانون العام.

(c) نبسط المسألة الى ابسط ما يكون.

**1) Find the derivative for the following function by using *the definition of derivative.***

a)  $f(x) = 7 - 2x$

$$\hat{f}(x) = \lim_{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}$$

$$\Rightarrow f(x) = 7 - 2x$$

$$f(x+h) = 7 - 2(x+h)$$

$$\begin{aligned}\hat{f}(x) &= \lim_{h \rightarrow 0} \frac{7-2(x+h)-(7-2x)}{h} \\ &= \lim_{h \rightarrow 0} \frac{7-2x-2h-7+2x}{h} \\ &= \lim_{h \rightarrow 0} \frac{-2h}{h} = -2\end{aligned}$$

b)  $f(x) = \frac{1}{x}$

$$\hat{f}(x) = \lim_{h \rightarrow 0} \frac{f(x+h)-f(x)}{h}$$

$$\Rightarrow f(x) = \frac{1}{x}$$

$$f(x+h) = \frac{1}{x+h}$$

$$\hat{f}(x) = \lim_{h \rightarrow 0} \frac{\frac{1}{x+h} - \frac{1}{x}}{h}$$

$$\begin{aligned}
 &= \lim_{h \rightarrow 0} \frac{\frac{x-(x+h)}{x(x+h)}}{h} \\
 &= \lim_{h \rightarrow 0} \frac{x-x-h}{x.h.(x+h)} \\
 &= \lim_{h \rightarrow 0} \frac{-1}{x.(x+h)} = \frac{-1}{x^2}
 \end{aligned}$$

## HOMEWORK

**Q) By using the definition of the derivative find to  $\frac{dy}{dx} = \hat{f}(x)$**

- 1)**       $3x^3$ ,      **2)**  $x^2 + 1$ ,      **3)**  $x^5$ ,
- 4)**       $\frac{1}{x+1}$ ,      **5)**  $\frac{1}{x^2}$ ,      **6)**  $\sqrt{x+1}$ .

## SECOND LECTURE

### ***Example: (Slop of Curve & Tangent Line)***

1)

a) Find the slope of the curve ( $y = \frac{1}{x}$ ) at any point  $x = a \neq 0$ .

What is the slope at the point ( $x = -1$ )?

b) Where does the slope equal  $(\frac{-1}{4})$ ?

c) What happens to the tangent at the point  $(a, \frac{1}{a})$  as a change?

**Solution:**

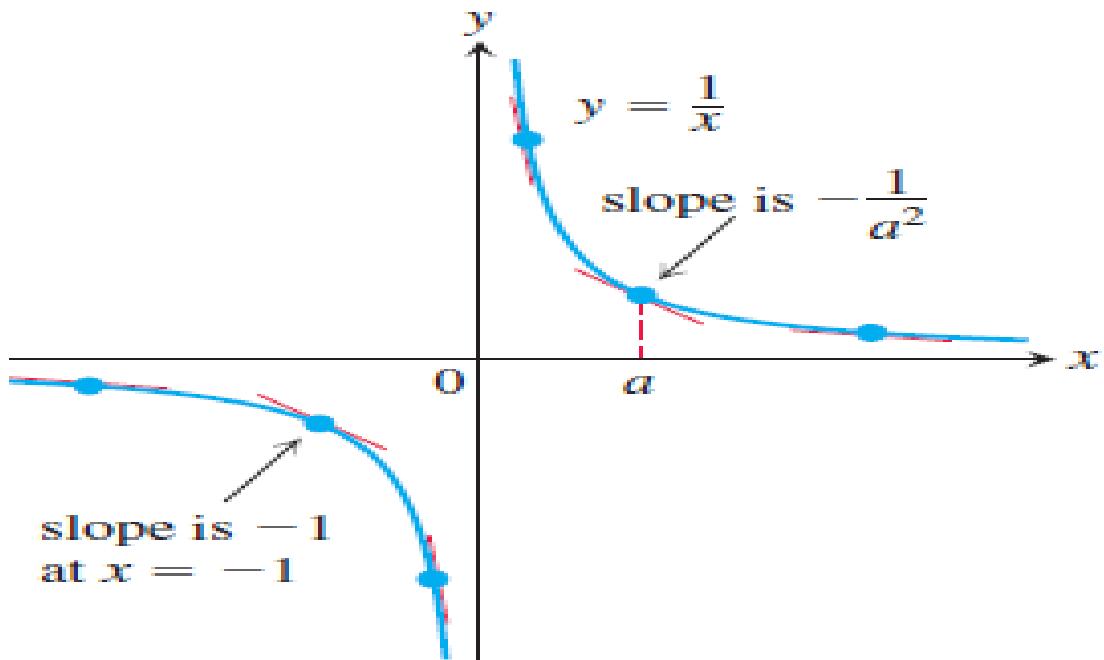

a) Here  $f(x) = \frac{1}{x}$ , the slope at  $(a, \frac{1}{a})$  is

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$$

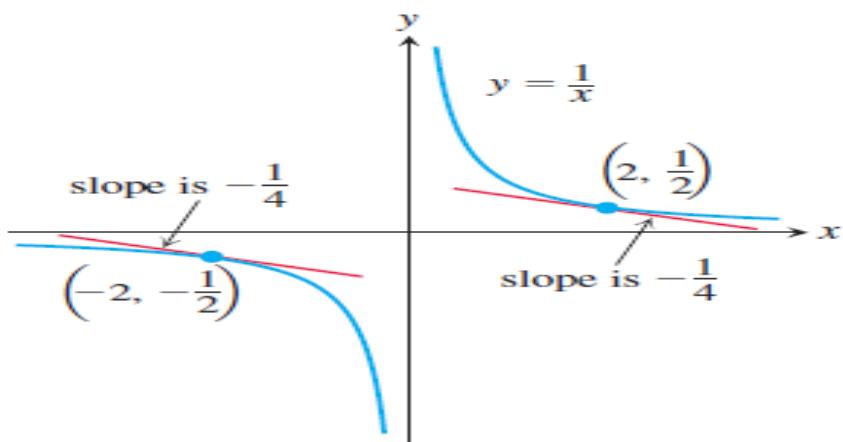

$$\Rightarrow f'(x) = \lim_{h \rightarrow 0} \frac{\frac{1}{a+h} - \frac{1}{a}}{h} = \lim_{h \rightarrow 0} \frac{\frac{a-(a+h)}{a(a+h)}}{h}$$

$$= \lim_{h \rightarrow 0} \frac{a-a-h}{a.h.(a+h)} = \lim_{h \rightarrow 0} \frac{-1}{a.(a+h)} = \frac{-1}{a^2}$$

The slope at the point ( $x = -1$ ) is  $f'(-1) = \frac{-1}{(-1)^2} = -1$ . See the graph below

**b)** The slope of  $y = \frac{1}{x}$  at the point where  $(x = a)$  is  $\frac{-1}{a^2}$ . It will be  $(\frac{-1}{4})$  provided that  $(\frac{-1}{a^2} = \frac{-1}{4})$ . This equation is equivalent to  $a^2 = 4$ , so  $a = \pm 2$ . The curve has slope  $(\frac{-1}{4})$  at the two points  $(2, \frac{1}{2})$  and  $(-2, -\frac{1}{2})$ . See the graph below

**c) H.W**

**2) Find the slope of the graph of  $y = x^2 + 1$ , at the point (2, 5) and find the equation of the tangent line at this point.**

**Solution**

$$\begin{aligned}\hat{f}(x) &= \lim_{h \rightarrow 0} \frac{f(x+h)-f(x)}{h} = \lim_{h \rightarrow 0} \frac{((x+h)^2+1)-(x^2+1)}{h} \\ &= \lim_{h \rightarrow 0} \frac{x^2+2xh+h^2+1-x^2-1}{h} = \lim_{h \rightarrow 0} \frac{h(2x+h)}{h} = 2x \\ \therefore \hat{f}(x) &= 4\end{aligned}$$

The tangent line is the line through the point (2, 5) with slope 4.

$$y - 5 = 4(x - 2) \Rightarrow y = 4x - 3.$$

**3) The function  $f(x) = |x|$  has a corner at  $x = 0$ , prove that  $f$  is not differentiable at  $x = 0$ .**

**Solution**

$$\hat{f}(0) = \lim_{h \rightarrow 0} \frac{f(0+h)-f(0)}{h} = \lim_{h \rightarrow 0} \frac{|h|}{h},$$

$$\text{But } \frac{|h|}{h} = \begin{cases} 1, & \text{if } h > 0 \\ -1, & \text{if } h < 0 \end{cases},$$

So that  $\lim_{h \rightarrow 0^-} \left( \frac{|h|}{h} \right) = -1$ ,  $\lim_{h \rightarrow 0^+} \left( \frac{|h|}{h} \right) = 1$ .

Thus,  $\hat{f}(0) = \lim_{h \rightarrow 0} \frac{|h|}{h}$  does not exist.

**4)**

**a) Find by definition of the derivative of**

$$f(x) = \sqrt{x}, \text{ for } x > 0$$

**b) Find the tangent line to the curve  $y = \sqrt{x}$  at  $x = 4$**

**Solution:**

$$\begin{aligned}\text{a) } \hat{f}(x) &= \lim_{h \rightarrow 0} \frac{f(x+h)-f(x)}{h} = \lim_{h \rightarrow 0} \frac{\sqrt{x+h}-\sqrt{x}}{h} \times \frac{\sqrt{x+h}+\sqrt{x}}{\sqrt{x+h}+\sqrt{x}} \\ \hat{f}(x) &= \lim_{h \rightarrow 0} \frac{x+h-x}{h(\sqrt{x+h}+\sqrt{x})} = \lim_{h \rightarrow 0} \frac{h}{h(\sqrt{x+h}+\sqrt{x})} = \lim_{h \rightarrow 0} \frac{1}{(\sqrt{x+h}+\sqrt{x})} \\ \therefore \hat{f}(x) &= \lim_{h \rightarrow 0} \frac{1}{2\sqrt{x}}\end{aligned}$$

The slope at  $x = 4 \Rightarrow \hat{f}(x) = m = \frac{1}{2\sqrt{4}}$

**b)** The tangent line is the line through  $(x = 4, y = \sqrt{4} = 2)$ , then the point is  $(4,2)$  with slope  $\frac{1}{4}$ ,

$$m = \frac{y - y_1}{x - x_1}$$

$$\Rightarrow y = 2 + \frac{1}{4}(x - 4) = 2 + \frac{x}{4} - 1 = 1 + \frac{x}{4} = \frac{4+x}{4}$$

## Notation of Differentiation

$$\hat{f}(x) = \dot{y} = \frac{dy}{dx} = \frac{df}{dx} = \frac{d}{dx} f(x) = D(f)(x) = D_x f(x)$$

➤  $\frac{dy}{dx}$  = the derivative of  $y$  with respect to  $x$

➤  $\dot{y}$  = prime notation

➤ To indicate the value of a derivative at a specified number

$$x = a = \dots$$

$$\hat{f}(a) = \frac{dy}{dx} \Big|_{x=a} = \frac{df}{dx} \Big|_{x=a} = \frac{d}{dx} f(x) \Big|_{x=a}$$

For example,  $\dot{y} = \hat{f}(x) = \frac{1}{2\sqrt{x}}$ .

When  $x = 4$

$$\hat{f}(x) = \frac{1}{2\sqrt{x}} \Big|_{x=a} = \frac{1}{2\sqrt{4}} = \frac{1}{4}$$

# ***Techniques of Differentiation***

## ***(Rules of Derivative)***

**Theorem:** If  $f$  and  $g$  are two differentiations, and  $c$  is any constant, then

$$1) \frac{d}{dx} c = 0$$

$$2) \frac{d}{dx} x = 1$$

$$3) \frac{d}{dx} x^n = n \cdot x^{n-1}$$

$$4) \frac{d}{dx} c \cdot f(x) = c \cdot \frac{d}{dx} f(x)$$

$$5) \frac{d}{dx} [f(x) \pm g(x)] = \frac{d}{dx} f(x) \pm \frac{d}{dx} g(x)$$

$$6) \frac{d}{dx} [f(x) \cdot g(x)] = f(x) \cdot \frac{d}{dx} g(x) + g(x) \frac{d}{dx} f(x) = f \dot{g} + g \cdot \dot{f}$$

$$7) \frac{d}{dx} \left[ \frac{f(x)}{g(x)} \right] = \frac{g(x) \frac{d}{dx} f(x) - f(x) \cdot \frac{d}{dx} g(x)}{(g(x))^2} = \frac{g \cdot \dot{f} - f \cdot \dot{g}}{g^2}$$

$$8) \frac{d}{dx} c \cdot (g(x))^n = n \cdot c (g(x))^{n-1} \cdot \frac{d}{dx} g(x)$$

### **Examples:**

**Find  $\dot{y}$  for the following function**

a)  $f(x) = \sqrt{x}$

$$\Rightarrow f(x) = x^{\frac{1}{2}} = \dot{f}(x) = \frac{1}{2} x^{\frac{1}{2}-1} = \frac{1}{2} x^{-\frac{1}{2}} = \frac{1}{2\sqrt{x}}$$

b)  $f(x) = (4x^2 - 1)(7x^3 + x)$

$$\begin{aligned} \Rightarrow \dot{f}(x) &= (4x^2 - 1)(21x^2 + 1) + (7x^3 + x)(8x) \\ &= 140x^4 - 9x^2 - 1 \end{aligned}$$

c)  $f(x) = \frac{x^2-1}{x^4+1}$

$$\Rightarrow \dot{f}(x) = \frac{(x^4+1).2x - (x^2-1).4x^3}{(x^4+1)^2} = \frac{2x^5 - 4x^3 - 2x}{(x^4+1)^2}$$

## **Higher Derivative**

**Definition:** If  $y = f(x)$  is a differentiable function, then its derivative  $\dot{f}(x)$  is also a function. If  $\dot{f}$  is also differentiable, then we can differentiate  $\dot{f}$  to get a new function of  $x$  denoted by  $\ddot{f}$ . So,  $\ddot{f} = (\dot{f})'$ . The function  $\ddot{f}$  is called the **second derivative** of  $f$  because it is the derivative of the first derivative. It is written in several ways:

$$f''(x) = \frac{d^2y}{dx^2} = \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{dy'}{dx} = y'' = D^2(f)(x) = D_x^2 f(x).$$

### **Examples:**

1) If  $f(x) = 3x^4 - 2x^3 + x^2 - 4x + 2$ , find  $f^{(5)}$

#### **Solution:**

$$\dot{f}(x) = 12x^3 - 6x^2 + 2x - 4,$$

$$f''(x) = 36x^2 - 12x + 2,$$

$$f^{(3)}(x) = 72x - 12,$$

$$f^{(4)}(x) = 72,$$

$$f^{(5)}(x) = 0.$$

2)  $f(x) = \frac{1}{x}$ , find  $f^{(3)}$

#### **Solution:**

$$\dot{f}(x) = \frac{-1}{x^2},$$

$$f''(x) = \frac{2}{x^3}, \quad f^{(3)}(x) = \frac{-6}{x^4}$$

## THIRD LECTURE

### ***Implicit Differentiation***

**Definition:** We will say that a given equation in  $x$  and  $y$  defines the function  $f$  implicitly  $y$  if the graph of  $y = f(x)$  coincides with a portion of the graph of the equation.

نستخدم الاشتقاق الضمني في حالة اعطاء الدالة بمتغيرين او اكثر حيث نشتق التغير المستقل (Independent) اشتقاقا صريحا, اما المتغير المعتمد (Dependent) نشتقه اشتقاقا ضمنيا, اذ ان المتغير المعتمد هو المتغير الذي يعتمد على متغيرات اخرى اما المتغير المستقل فهو المتغير الذي يُشتق بالنسبة له.

#### **Examples:**

***Find the  $f'(x)$  for the following functions.***

1)  $x^2 + y^2 = 1$

$$2x + 2y \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = -\frac{x}{y}$$

2)  $\frac{1}{y} + xy = x$

$$-\frac{1}{y^2} \frac{dy}{dx} + \left( x \frac{dy}{dx} + y \right) = 1 \Rightarrow \frac{dy}{dx} \left( x - \frac{1}{y^2} \right) = 1 - y$$

$$\Rightarrow \frac{dy}{dx} = \frac{1-y}{\left( xy^2 - 1 \right)} \Rightarrow \frac{dy}{dx} = \frac{y^2(1-y)}{xy^2-1}$$

3)  $(x^2 + y^2)^{\frac{1}{2}} = 1$

$$\frac{1}{2}(x^2 + y^2)^{-\frac{1}{2}} \cdot \left( 2x + 2y \frac{dy}{dx} \right) = 0 \Rightarrow \frac{x}{\sqrt{x^2+y^2}} + \frac{y}{\sqrt{x^2+y^2}} \frac{dy}{dx} = 0$$

$$\Rightarrow \frac{dy}{dx} = -\frac{x}{y}$$

## Chain Rule

**Definition:** Let  $y = f(t)$  and  $t = g(x)$ , **the chain rule** may be written as:

$$\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$$

### Examples:

1) If  $y = t^3 + 6$  and  $x = 2t + 4$ , find  $\frac{dy}{dx}$

#### Solution

$$\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx}$$

$$\Rightarrow \frac{dy}{dt} = 3t^2, \quad \frac{dx}{dt} = 2 \Rightarrow \frac{dt}{dx} = \frac{1}{2}$$

$$\Rightarrow \frac{dy}{dx} = 3t^2 \cdot \frac{1}{2} = \frac{3}{2}t^2$$

2) If  $y = \frac{t^2}{t^2+1}$  and  $t = \sqrt{2x+1}$ , find  $\frac{dy}{dx}$

#### Solution

$$\frac{dy}{dx} = \frac{dy}{dt} \cdot \frac{dt}{dx}$$

$$\Rightarrow \frac{dy}{dt} = \frac{(t^2+1)(2t) - (t^2)(2t)}{(t^2+1)^2} = \frac{2t^3 + 2t - 2t^3}{(t^2+1)^2} = \frac{2t}{(t^2+1)^2}$$

$$\Rightarrow \frac{dt}{dx} = \frac{1}{2}(2x+1)^{-\frac{1}{2}} \cdot 2 = \frac{1}{\sqrt{2x+1}}$$

$$\therefore \frac{dy}{dx} = \frac{2t}{(t^2+1)^2} \cdot \frac{1}{\sqrt{2x+1}}$$

$$\Rightarrow \frac{2\sqrt{2x+1}}{((\sqrt{2x+1})^2+1)^2} \cdot \frac{1}{\sqrt{2x+1}} = \frac{2\sqrt{2x+1}}{((2x+1)+1)^2} \cdot \frac{1}{\sqrt{2x+1}} = \frac{1}{2(x+1)^2}$$

$$\therefore \frac{dy}{dx} = \frac{1}{2(x+1)^2}$$

# HOMEWORK

a) Find the first & second derivative for the following equations.

1)  $y = \frac{x^3 + 7}{x}$

2)  $r = \frac{(\theta - 1)(\theta^2 + \theta + 1)}{\theta^3}$

3)  $w = \left(\frac{1+3z}{3z}\right)(3-z)$

4)  $w = 3z^2 e^{2z}$

b) Find  $\frac{dy}{dx}$  for the function:  $y^3 + xy^2 + y + x - 8 = 0$ .

c) Find  $\frac{dy}{dt}$  by using the chain rule for the given equation

$y = 2u^4 + 4u^2$  &  $u = 2t^3 + t^2 - t$ , and evaluate  $\frac{dy}{dt}$  at  $t = 0$ .

## FOURTH LECTURE

# **Transcendental Functions**

## **The Trigonometric Functions**

$$\sin\theta = \frac{\text{Opposite}}{\text{Hypotenuse}} = \frac{y}{r}$$

$$\cos\theta = \frac{\text{Adjance}}{\text{Hypotenuse}} = \frac{x}{r}$$

$$\tan\theta = \frac{\text{Opposite}}{\text{Adjance}} = \frac{y}{x}$$

$$\sec\theta = \frac{1}{\cos\theta} = \frac{r}{x}$$

$$\csc\theta = \frac{1}{\sin\theta} = \frac{r}{y}$$

$$\cot\theta = \frac{1}{\tan\theta} = \frac{x}{y}$$

By Pythagorean theorem we get:

$$\sin\theta = \frac{y}{r} \Rightarrow \sin^2\theta = \frac{y^2}{r^2}, \cos\theta = \frac{x}{r} \Rightarrow \cos^2\theta = \frac{x^2}{r^2}$$

$$\sin^2\theta + \cos^2\theta = \frac{y^2}{r^2} + \frac{x^2}{r^2} = \frac{y^2+x^2}{r^2} = \frac{r^2}{r^2} = 1$$

$$\therefore \sin^2\theta + \cos^2\theta = 1$$

**1)  $\theta = 0^\circ$**

$$\cos\theta = \frac{x}{r} = \frac{r}{r} = 1 \Rightarrow \cos\theta = 1$$

$$\sin\theta = \frac{y}{r} = \frac{0}{r} = 0 \Rightarrow \sin\theta = 0$$

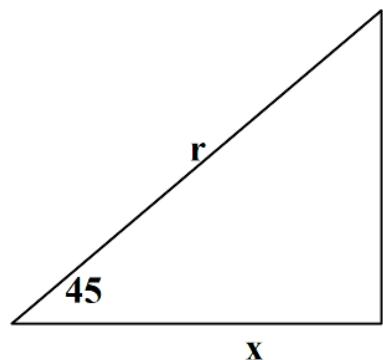

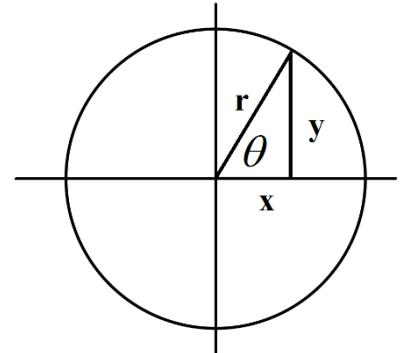

**2)  $\theta = 90^\circ$**

$$\cos\theta = \frac{x}{r} = \frac{0}{r} = 0 \Rightarrow \cos\theta = 0$$

$$\sin\theta = \frac{y}{r} = \frac{r}{r} = 1 \Rightarrow \sin\theta = 1$$

**3)  $\theta = 45^\circ$**

$$x^2 + y^2 = r^2, y = x$$

	0	$45 = \frac{\pi}{4}$	$30 = \frac{\pi}{6}$	$60 = \frac{\pi}{3}$	$90 = \frac{\pi}{2}$	$\pi$	$\frac{3\pi}{2}$	$2\pi$
--	---	----------------------	----------------------	----------------------	----------------------	-------	------------------	--------

$$x^2 + x^2 = r^2 \Rightarrow 2x^2 = r^2 \Rightarrow r = x\sqrt{2}$$

$$y^2 + y^2 = r^2 \Rightarrow 2y^2 = r^2 \Rightarrow r = y\sqrt{2}$$

$$\cos\theta = \frac{x}{x\sqrt{2}} = \frac{1}{\sqrt{2}} \Rightarrow \cos\theta = \frac{1}{\sqrt{2}}$$

$$\sin\theta = \frac{y}{y\sqrt{2}} = \frac{1}{\sqrt{2}} \Rightarrow \sin\theta = \frac{1}{\sqrt{2}}$$

4)  $\theta = 30^\circ$

$$x^2 + y^2 = r^2$$

$$L^2 + y^2 = 4L^2 \Rightarrow y^2 = 3L^2 \Rightarrow y = \sqrt{3}L$$

by same we get:  $x = \sqrt{3}L$

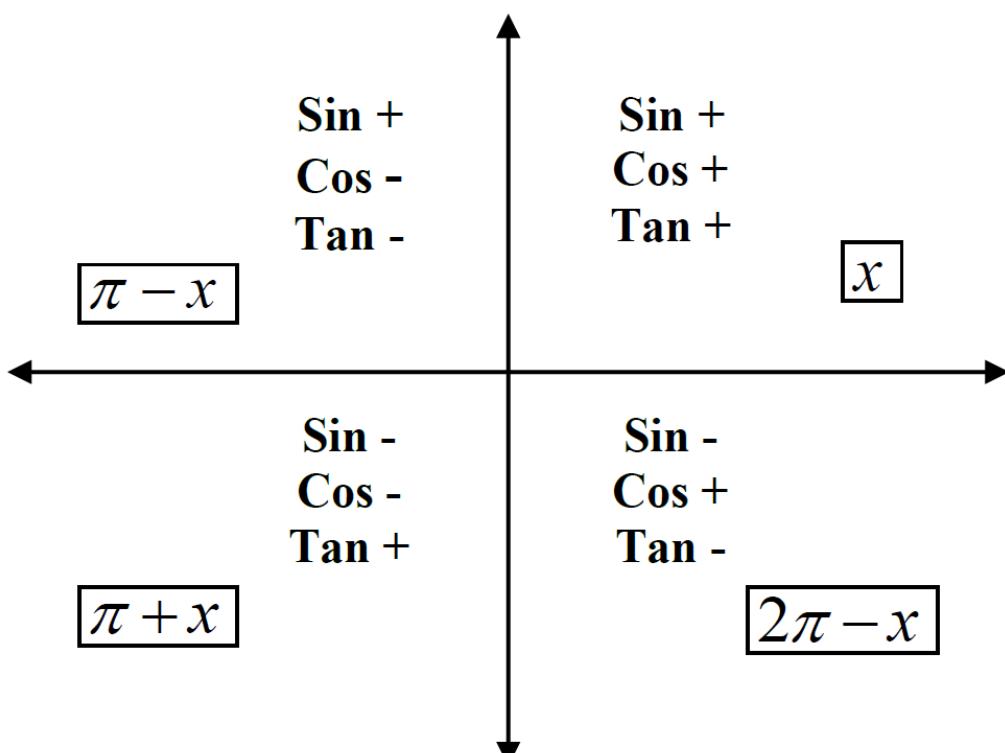

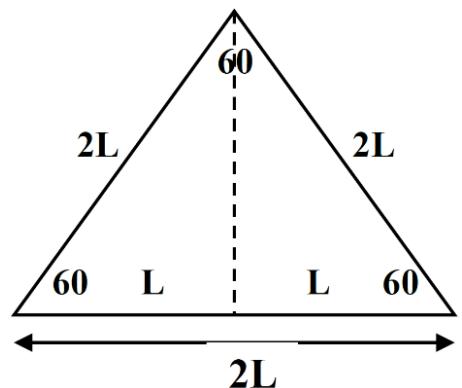

$$\cos\theta = \frac{x}{r} = \frac{\sqrt{3}L}{2L} \Rightarrow \cos\theta = \frac{\sqrt{3}}{2}$$

$$\sin\theta = \frac{y}{r} = \frac{L}{2L} \Rightarrow \sin\theta = \frac{1}{2}$$

5)  $\theta = 60^\circ$

$$\cos\theta = \frac{x}{r} = \frac{L}{2L} \Rightarrow \cos\theta = \frac{1}{2}$$

$$\sin\theta = \frac{y}{r} = \frac{\sqrt{3}L}{2L} \Rightarrow \sin\theta = \frac{\sqrt{3}}{2}$$

<b>Sin</b>	0	$1/\sqrt{2}$	$1/2$	$\sqrt{3}/2$	1	0	-1	0
<b>Cos</b>	1	$1/\sqrt{2}$	$\sqrt{3}/2$	$1/2$	0	-1	0	1
<b>Tan</b>	0	1	$1/\sqrt{3}$	$\sqrt{3}$	$\infty$	0	$\infty$	0

### **Some Rule of Trigonometric Function**

1)  $\sin^2\theta + \cos^2\theta = 1$

2)  $\sec^2\theta = 1 + \tan^2\theta$

3)  $\csc^2\theta = 1 + \cot^2\theta$

4)  $\sin(A \pm b) = \sin A \cos B \pm \cos A \sin B$

5)  $\cos(A \pm b) = \cos A \cos B \mp \sin A \sin B$

6)  $\tan(A \pm b) = \frac{\tan A \pm \tan B}{1 \mp \tan^2 A}$

7)  $\tan(2A) = \frac{2\tan A}{1 - \tan^2 A}$

8)  $\sin 2A = 2 \sin A \cos A$

9)  $\cos 2A = \cos^2 A - \sin^2 A$

10)  $\cos 2A = 1 - 2\sin^2 A$

11)  $\cos 2A = 2\cos^2 A - 1$

12)  $\sin^2 A = \frac{1}{2}(1 - \cos 2A)$

13)  $\cos^2 A = \frac{1}{2}(1 + \cos 2A)$

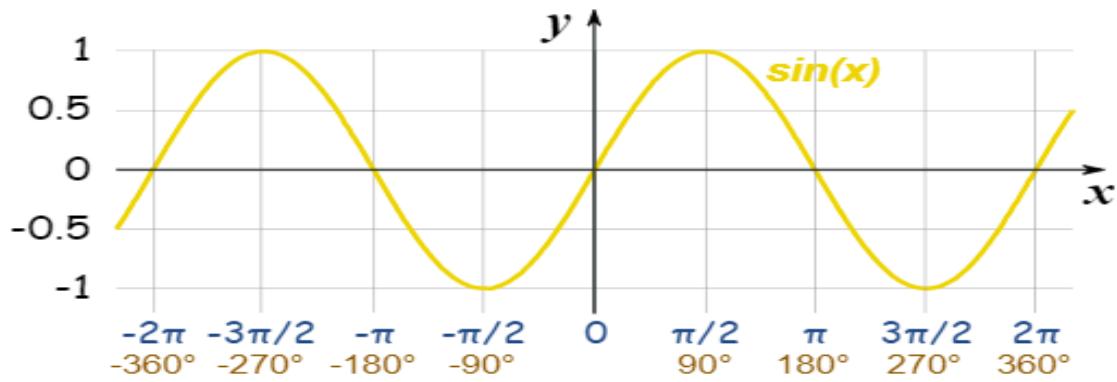

14)  $\sin A - \sin B = 2\sin \frac{A-B}{2} \cos \frac{A+B}{2}$

15)  $\sin(A + b) - \sin(A - B) = 2 \cos A \sin B$

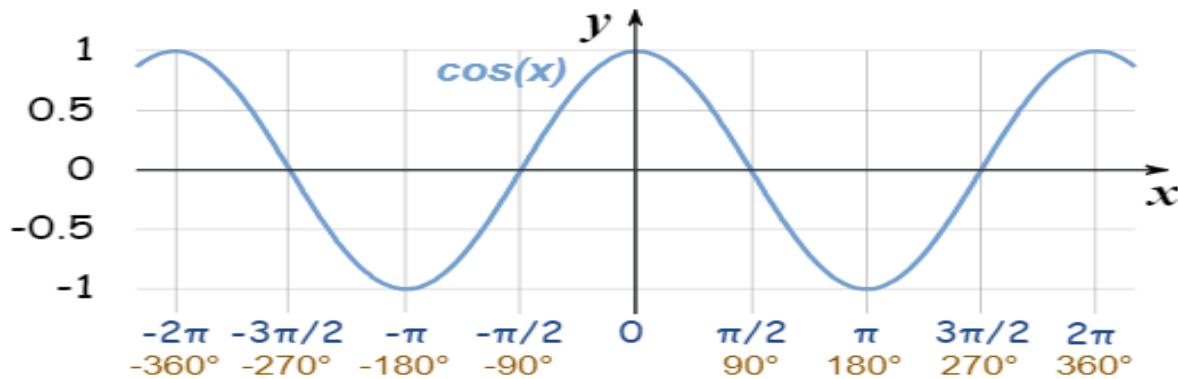

# Derivative of Trigonometric Functions

## The Rule Derivative

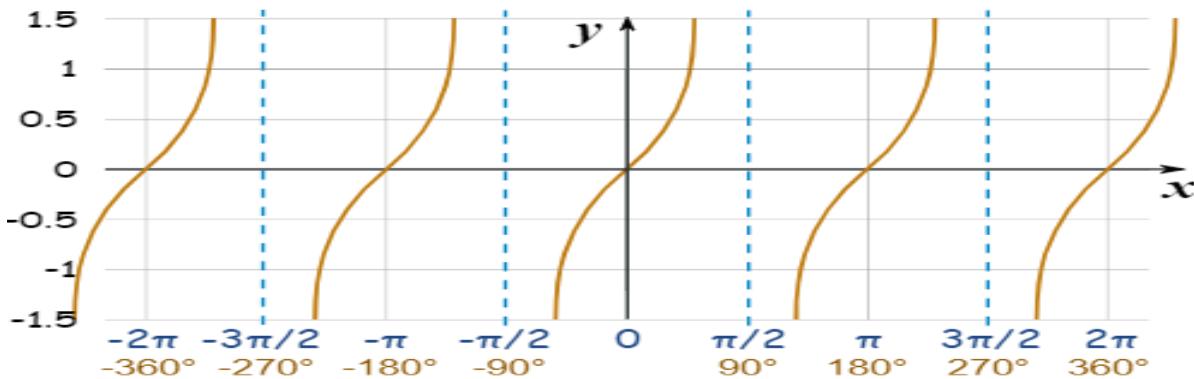

1)  $\frac{d}{dx} \sin x = \cos x \Rightarrow \text{in Gen.} \Rightarrow \frac{d}{dx} \sin u = \cos u \frac{du}{dx}$

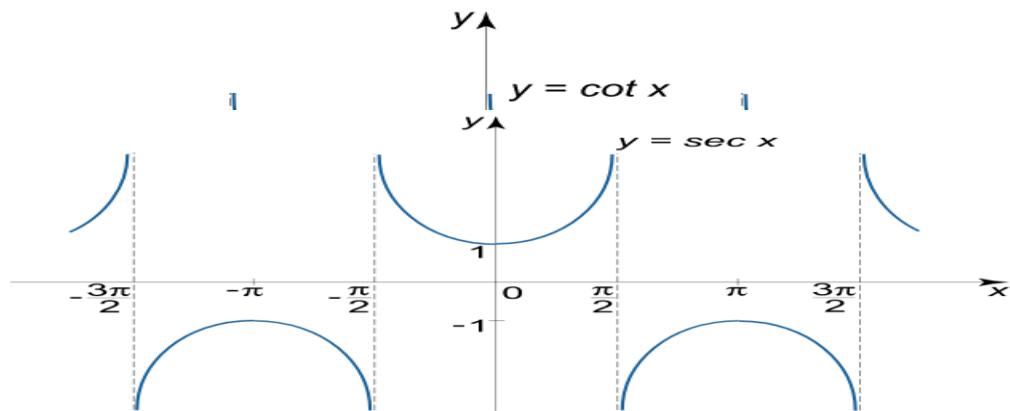

2)  $\frac{d}{dx} \cos x = -\sin x \Rightarrow \text{in Gen.} \Rightarrow \frac{d}{dx} \cos u = -\sin u \frac{du}{dx}$

3)  $\frac{d}{dx} \tan x = \sec^2 x \Rightarrow \text{in Gen.} \Rightarrow \frac{d}{dx} \tan u = \sec^2 u \frac{du}{dx}$

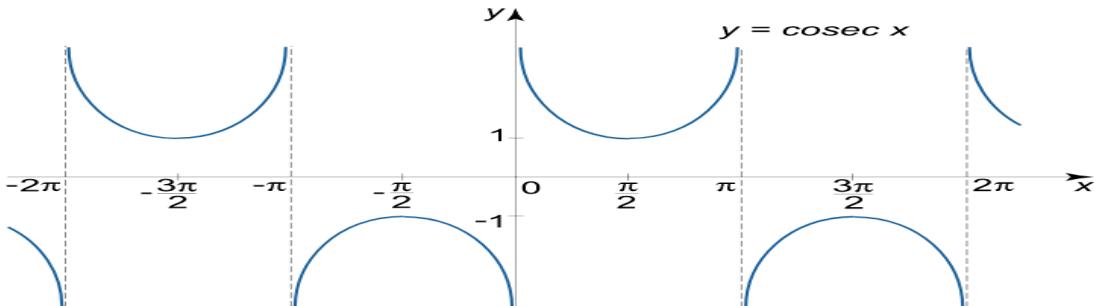

$$4) \frac{d}{dx} \cot x = -\csc^2 x \Rightarrow \text{in Gen.} \Rightarrow \frac{d}{dx} \cot u = -\csc^2 u \frac{du}{dx}$$

$$5) \frac{d}{dx} \sec x = \sec x \tan x \Rightarrow \text{in Gen.} \Rightarrow \frac{d}{dx} \sec u = \sec u \tan u \frac{du}{dx}$$

$$6) \frac{d}{dx} \csc x = -\csc x \cot x \Rightarrow \text{in Gen.} \Rightarrow \frac{d}{dx} \csc u = -\csc u \cot u \frac{du}{dx}$$

### Examples:

Find the derivative of the following functions:

$$1) y = \tan 3x$$

$$\Rightarrow \frac{dy}{dx} = \dot{y} = \sec^2 3x \cdot 3$$

$$2) y = \cos(3x^2 + 1)$$

$$\Rightarrow \frac{dy}{dx} = \dot{y} = -\sin(3x^2 + 1) \cdot 6x$$

$$3) y = x^2 \cdot \tan x$$

$$\Rightarrow \frac{dy}{dx} = \dot{y} = x^2 \cdot \sec^2 x + 2x \cdot \tan x$$

$$4) y = \frac{\sin x}{1+\cos x}$$

$$\begin{aligned}\Rightarrow \frac{dy}{dx} &= \dot{y} = \frac{(1+\cos x).\cos x - \sin x.(-\sin x)}{(1+\cos x)^2} \\ &= \frac{\cos x + \cos^2 x + \sin^2 x}{(1+\cos x)^2} = \frac{\cos x + 1}{(1+\cos x)^2} = \frac{1}{1+\cos x}\end{aligned}$$

5)  $y = \sec x \cdot \tan x$

**H.W**

## FIFTH LECTURE

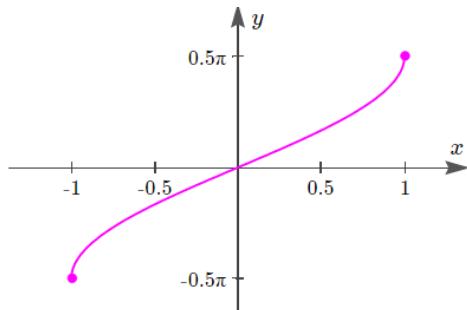

### *The Inverse Trigonometric Functions*

The Sin and Cosine functions can be written as:

$$\sin x = \frac{e^{ix} - e^{-ix}}{2i}, \quad \cos x = \frac{e^{ix} + e^{-ix}}{2}$$

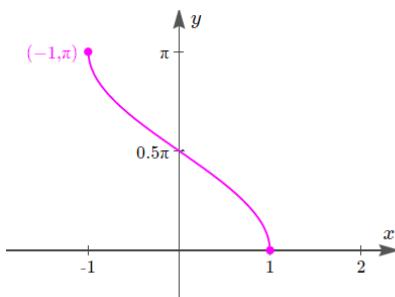

**Definition:** The inverse **sine fun.** Denoted by  $\sin^{-1}x$  is defined to be

the inverse of restricted sine fun.  $\sin x \quad -\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$

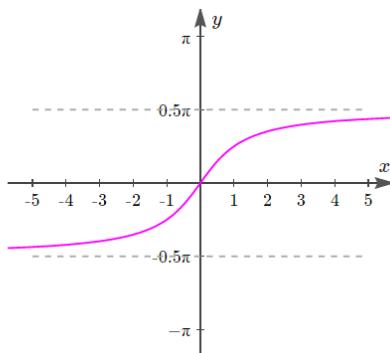

**Definition:** The inverse **cosine fun.** Denoted by  $\cos^{-1}x$  is defined to

be the inverse of restricted cosine fun.  $\cos x \quad 0 \leq x \leq \pi$

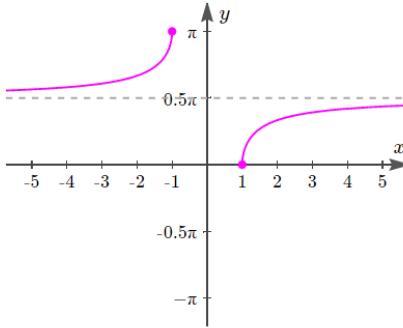

**Definition:** The inverse **tangent fun.** Denoted by  $\tan^{-1}x$  is defined to

be the inverse of restricted tangent fun.  $\tan x \quad -\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$

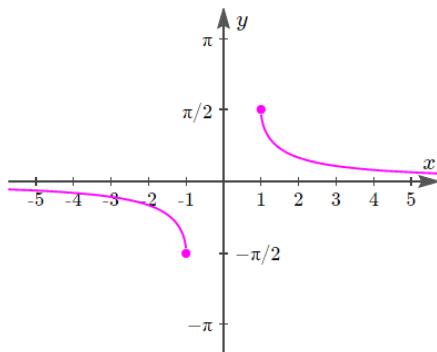

**Definition:** The inverse **secant fun.** Denoted by  $\sec^{-1}x$  is defined to

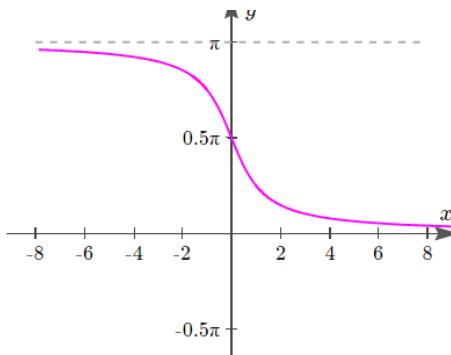

be the inverse of restricted secant fun.  $\sec x \quad 0 \leq x \leq \pi, x \neq \frac{\pi}{2}$

**Definition:** The inverse **cosecant fun.** Denoted by  $\csc^{-1}x$  is defined to be the inverse of restricted cosecant fun.  $\csc x \quad -\frac{\pi}{2} \leq x \leq \frac{\pi}{2}$

**Definition:** The inverse **cotangent fun.** Denoted by  $\cot^{-1}x$  is defined to be the inverse of restricted cosecant fun.  $\cot x \quad 0 \leq x \leq \pi$

**Note:** The  $(-1)$  in the expression for the inverse means “**inverse**”, it does not mean **reciprocal**. for example, the reciprocal of  $\sin x$  is  $(\sin x) = \frac{1}{\sin x} = \csc x, \sin^{-1}x \neq \frac{1}{\sin x}$

To get rid any trigonometric function we will take the inverse function to the original function, and to get rid any inverse trigonometric function

we will take the inverse function to the original function. The inverse of inverse function is the function the same.

## ***Properties of Inverse Trigonometric Function***

- |           |   |            |  |
|-----------|---|------------|--|
| <b>1)</b> | $\sin^{-1} + \cos^{-1} = \frac{\pi}{2}$       | <b>6)</b>  | $\sec^{-1}(x) = \cos^{-1}\left(\frac{1}{x}\right)$ |
| <b>2)</b> | $\tan^{-1} + \cot^{-1} = \frac{\pi}{2}$       | <b>7)</b>  | $\sec^{-1}(-x) = \pi - \sec^{-1}(x)$               |
| <b>3)</b> | $\sin^{-1}(-x) = -\sin^{-1}(x)$               | <b>8)</b>  | $\cot^{-1}(x) = \tan^{-1}\left(\frac{1}{x}\right)$ |
| <b>4)</b> | $\tan^{-1}(-x) = -\tan^{-1}(x)$               | <b>9)</b>  | $\csc^{-1}(x) = \sin^{-1}\left(\frac{1}{x}\right)$ |
| <b>5)</b> | $\cos^{-1}(x) = \frac{\pi}{2} - \sin^{-1}(x)$ | <b>10)</b> | $\cot^{-1}(x) = \frac{\pi}{2} - \tan^{-1}(x)$      |

### Note:

- $\cos(\sin^{-1}x) = \sqrt{1-x^2}$
- $\sin(\cos^{-1}x) = \sqrt{1-x^2}$
- $\tan(\sin^{-1}x) = \frac{x}{\sqrt{1-x^2}}$
- $\sin(\tan^{-1}x) = \frac{x}{\sqrt{1+x^2}}$

## ***Derivative of The Inverse Trigonometric Function***

- 1)**  $\frac{d}{dx} \sin^{-1}u = \frac{1}{\sqrt{1-u^2}} \frac{du}{dx}$
- 2)**  $\frac{d}{dx} \cos^{-1}u = \frac{-1}{\sqrt{1-u^2}} \frac{du}{dx}$
- 3)**  $\frac{d}{dx} \tan^{-1}u = \frac{1}{1+u^2} \frac{du}{dx}$
- 4)**  $\frac{d}{dx} \cot^{-1}u = \frac{-1}{1+u^2} \frac{du}{dx}$
- 5)**  $\frac{d}{dx} \sec^{-1}u = \frac{1}{|u|\sqrt{u^2-1}} \frac{du}{dx}$  , ( $1 < |u|$ )

6)  $\frac{d}{dx} \csc^{-1} u = \frac{-1}{|u| \sqrt{u^2 - 1}} \frac{du}{dx}$ , ( $1 < |u|$ )

### Examples:

1) Let  $y = \sin^{-1} u$ . Prove  $\frac{d}{dx} \sin^{-1} u = \frac{1}{\sqrt{1-u^2}} \frac{du}{dx}$

**Solution:**

Let  $u = \sin y$ ,  $\Rightarrow \frac{du}{dx} = \cos y \cdot \frac{dy}{dx}$

From  $\sin^2 y + \cos^2 y = 1$

$$\Rightarrow \cos^2 y = 1 - \sin^2 y$$

$$\Rightarrow \cos y = \sqrt{1 - \sin^2 y} = \sqrt{1 - u^2}$$

$$\frac{dy}{dx} = \frac{1}{\cos y} \frac{du}{dx}$$

$$\therefore \frac{dy}{dx} = \frac{1}{\sqrt{1 - \sin^2 y}} \frac{du}{dx} = \frac{1}{\sqrt{1 - u^2}} \frac{du}{dx}$$

2)  $y = \tan^{-1}(\frac{x+1}{x-1})$ , find  $\frac{dy}{dx}$

**Solution:**

$$\therefore \frac{d}{dx} \tan^{-1} u = \frac{1}{1 + u^2} \frac{du}{dx}$$

Where  $u = \frac{x+1}{x-1} \Rightarrow u^2 = (\frac{x+1}{x-1})^2$

$$\frac{du}{dx} = \frac{(x-1)(1) - (x+1)(1)}{(x-1)^2} = \frac{(x-1) - (x+1)}{(x-1)^2} = \frac{-2}{(x-1)^2}$$

$$\therefore \frac{d}{dx} \tan^{-1} u = \frac{1}{1 + (\frac{x+1}{x-1})^2} \cdot \frac{-2}{(x-1)^2}$$

**Note:**

$$\frac{dy}{dx} = \frac{1}{\frac{dx}{dy}}$$

3) Find  $\frac{dy}{dx}$ , if

a)  $y = \sin^{-1}(x^3)$

**Solution:**

$$\frac{dy}{dx} = \frac{1}{\sqrt{1-(x^3)^2}} \cdot 3x^2 = \frac{3x^2}{\sqrt{1-x^6}}$$

b)  $y = \sec^{-1}(e^x)$

**Solution:**

$$\therefore \frac{d}{dx} \sec^{-1} u = \frac{1}{|u| \sqrt{u^2-1}} \frac{du}{dx}$$

$$\therefore \frac{dy}{dx} = \frac{1}{e^x \sqrt{(e^x)^2-1}} e^x$$

## SIXTH LECTURE

# **The Logarithm and Exponential Functions**

## **The Logarithm Function**

**Definition:** The natural logarithm of a positive number  $x$ , written as  $\ln x$ , is defined as an integral.

$$\ln(x) = \int_1^x \frac{1}{t} dt, \quad x > 0$$

**Definition:** The number  $e$  is the number in the domain of the natural logarithm that satisfies

$$\ln(e) = \int_1^e \frac{1}{t} dt = 1$$

## **Properties of Logarithms**

**Theorem:** For any numbers  $b > 0$  and  $x > 0$ , the natural logarithm satisfies the following rules:

**1) Product Rule:**  $\ln ab = \ln a + \ln b$

**2) Quotient Rule:**  $\ln \frac{a}{b} = \ln a - \ln b$

**3) Reciprocal Rule:**  $\ln \frac{1}{a} = -\ln a$

**4) Power Rule:**  $\ln a^r = r \ln a$ , for  $r$  rational number.

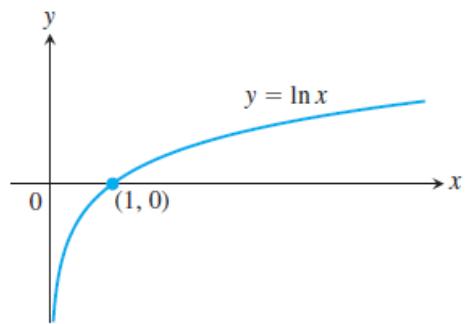

**5)**  $\ln 1 = 0$

**6)**  $\ln e = 1$ ,  $e = 2.718 \dots$

**7)** Graph of  $y = \ln(x)$  is:

### **Example:**

**Apply the result in above theorem**

- a)  $\ln 4 + \ln \sin x = \ln 4 \sin x$  *Product Rule*
- b)  $\ln \frac{x+1}{2x-3} = \ln(x+1) - \ln(2x-3)$  *Quotient Rule*
- c)  $\ln \frac{1}{8} = -\ln 8$  *Reciprocal Rule*  
 $= -\ln 2^3$  *Power Rule*  
 $= -3\ln 2$

### **The Derivative of $y = \ln x$**

$$\frac{d}{dx} \ln x = \frac{d}{dx} \int_1^x \frac{1}{t} dt = \frac{1}{x}$$

In general form:

$$\frac{d}{dx} \ln(u) = \frac{1}{u} \frac{du}{dx}$$

#### **Example:**

**Find the  $\dot{y}$  for the following functions:**

- 1)  $y = \ln x \Rightarrow \dot{y} = \frac{1}{x}$
- 2)  $y = \ln(x^3 + 1) \Rightarrow \dot{y} = \frac{3x^2}{x^3 + 1}$
- 3)  $y = 1 + \ln(x - 1) \Rightarrow \dot{y} = \frac{1}{x-1}$
- 4)  $y = \ln \sqrt[3]{x^2 - 5} \Rightarrow y = \ln(x^2 - 5)^{\frac{1}{3}} \Rightarrow \dot{y} = \frac{1}{3} \ln(x^2 - 5)$   
 $\Rightarrow \dot{y} = \frac{2x}{3(x^2 - 5)}$
- 5)  $y = \ln \sin x \Rightarrow \dot{y} = \frac{1}{\sin x} \cos x = \cot x$
- 6)  $y = \ln^2 3x \Rightarrow y = (\ln 3x)^2$   
 $\Rightarrow \dot{y} = 2 \ln 3x \cdot \frac{1}{3x} \cdot 3 = \frac{2 \ln 3x}{x}$

### **The Logarithm Differentiation**

## الاشتقاق اللوغاريتمي

يستخدم الاشتقاق اللوغاريتمي في حالة عدم استطاعتنا اشتقاق الدالة المعطاة بالطرق السابقة وعادة ما تستخدم هذه الطريقة في الدوال المضروبة ببعضها وتحوي على حدود كثيرة وتتلخص الطريقة كالتالي:

- (1) اخذ لوغاريتم  $\ln$  للطرفين.
- (2) نبسط الدالة باستخدام خواص اللوغاريتمات.
- (3) نشق الطرفين ضمنيا بالنسبة ل  $x$ .
- (4) ضرب الطرفين ب  $y$ .
- (5) تعويض قيمة  $y$  بما يعادلها بالمتغير  $x$ .

### ***Examples:***

**Find  $\frac{dy}{dx}$  the following functions by using Logarithmic Method**

1)  $y = x^x$

**solution**

$$\ln y = \ln x^x = x \ln x$$

$$\frac{1}{y} \frac{dy}{dx} = x \frac{1}{x} + \ln x (1) = 1 + \ln x$$

$$\frac{dy}{dx} = y(1 + \ln x) = x^x(1 + \ln x)$$

2)  $y = \frac{\sqrt[3]{2x^2+1} \cdot \sqrt{2x+1}}{(x^2+1)^4}$

**solution**

$$\ln y = \ln \frac{(2x^2+1)^{\frac{1}{3}} \cdot (2x+1)^{\frac{1}{2}}}{(x^2+1)^4}$$

$$\ln y = \ln [(2x^2+1)^{\frac{1}{3}} \cdot (2x+1)^{\frac{1}{2}}] - \ln(x^2+1)^4$$

$$\ln y = \frac{1}{3} \ln(2x^2+1) + \frac{1}{2} \ln(2x+1) - 4 \ln(x^2+1)$$

$$\frac{1}{y} \frac{dy}{dx} = \frac{1}{3} \frac{1}{(2x^2+1)} \cdot 4x + \frac{1}{2} \frac{1}{(2x+1)} \cdot 2 - 4 \frac{1}{(x^2+1)} \cdot 2x$$

$$y' = y \left[ \frac{4x}{3(2x^2+1)} + \frac{1}{(2x+1)} - \frac{8x}{(x^2+1)} \right]$$

$$y' = \left( \frac{\sqrt[3]{2x^2+1} \cdot \sqrt{2x+1}}{(x^2+1)^4} \right) \left( \frac{4x}{3(2x^2+1)} + \frac{1}{(2x+1)} - \frac{8x}{(x^2+1)} \right)$$

3)  $y = x^{\sin x}$

### **Solution**

$$\ln y = \ln x^{\sin x}$$

$$\ln y = \sin x \ln x$$

$$\frac{1}{y} \cdot \frac{dy}{dx} = \sin(x) \cdot \frac{1}{x} + \ln x \cos(x)$$

$$\frac{dy}{dx} = y \left[ \frac{\sin(x)}{x} + \ln x \cos(x) \right]$$

$$\frac{dy}{dx} = (x^{\sin x}) \left[ \frac{\sin(x)}{x} + \ln x \cos(x) \right]$$

4)  $y = x^x + x^{\ln x}$

### **Solution:**

$$y = y_1 + y_2$$

$$y' = y'_1 + y'_2$$

$$y_1 = x^x$$

$$\ln y_1 = \ln x^x \Rightarrow \ln y_1 = x \ln x$$

$$\frac{1}{y_1} \frac{dy_1}{dx} = x \frac{1}{x} + \ln x \cdot 1$$

$$\begin{aligned} y'_1 &= y_1 [1 + \ln x] \Rightarrow y'_1 = (x^x)[1 + \ln x] \\ &\Rightarrow y'_1 = [x^x + x^x \ln x] \end{aligned}$$

$$y_2 = x^{\ln(x)}$$

$$\ln y_2 = \ln x^{\ln x}$$

$$\ln y_2 = \ln x \ln x$$

$$\frac{1}{y_2} \frac{dy_2}{dx} = \left[ \ln x \frac{1}{x} + \ln x \frac{1}{x} \right]$$

$$\frac{dy_2}{dx} = y_2 \left[ \frac{\ln x}{x} + \frac{\ln x}{x} \right]$$

$$y'_2 = (\ln x^{\ln x}) \left[ \frac{2 \ln x}{x} \right]$$

$y' = y'_1 + y'_2$

$$y' = [x^x + x^x \ln x] + (\ln x^{\ln x}) \left[ \frac{2 \ln x}{x} \right]$$

## The Logarithm with base a

اللوجاريتم الطبيعي هو اللوجاريتم الذي اساسه e ويمكن ان يكتب بصيغة اخر هي:

$$\log_e x = \ln x$$

اما اللوجاريتم الاعتيادي الذي اساسه ليس e مثل اللوجاريتم العشري واللوجاريتم الذي اساسه a، وهنالك

علاقة مهمة تربط اللوجاريتم الاعتيادي باللوجاريتم الطبيعي وهي:

$$\log_a x = \frac{\log x}{\log a} = \frac{\ln x}{\ln a}, \quad a \neq 1$$

For example:  $\log_7 x = \frac{\ln x}{\ln 7}$

## The Derivative of $\log_a x$

$$\frac{d}{dx} \log_a x = \frac{d}{dx} \frac{\ln x}{\ln a} = \frac{1}{x \ln a}$$

$$\therefore \frac{d}{dx} \log_a x = \frac{1}{x \ln a}$$

And in general form:

$$\frac{d}{dx} \log_a u = \frac{du}{dx} \frac{1}{u \ln a}$$

### Examples:

1) Find  $\frac{dy}{dx}$  to  $y = \log_2(3x + 1)$

#### Solution

$$a) \quad y = \frac{\ln(3x+1)}{\ln 2} \Rightarrow \frac{dy}{dx} = \frac{3}{(3x+1)\ln 2}$$

$$b) \quad \frac{dy}{dx} = \frac{3}{(3x+1)\ln 2}$$

2) Find  $\frac{dy}{dx}$  to  $y = \ln \ln x + \log_3(x^2 + 5)$

#### Solution

$$\frac{dy}{dx} = \frac{1}{x \ln x} + \frac{2x}{(x^2+5)\ln 3}$$

## SEVENTH LECTURE

### *The Exponential Functions*

**Definition:** The function  $y = e^x$ , is the exponential function, where  $e \approx 2.718\dots$

**Note:** the exponential function is the inverse of Log. Fun.

$$\triangleright y = \ln x = \log_e x \Rightarrow e^y = e^{\ln x} = x$$

$$\therefore y = x$$

$$\triangleright e^y = x$$

$$\ln x = \ln e^y$$

$$= y \ln e \Rightarrow \ln x = y$$

$$\therefore y = \ln x$$

### *Properties of Exponential Function*

1)  $\ln e = 1$

2)  $e^0 = 1$

3)  $e^{a+b} = e^a \cdot e^b$

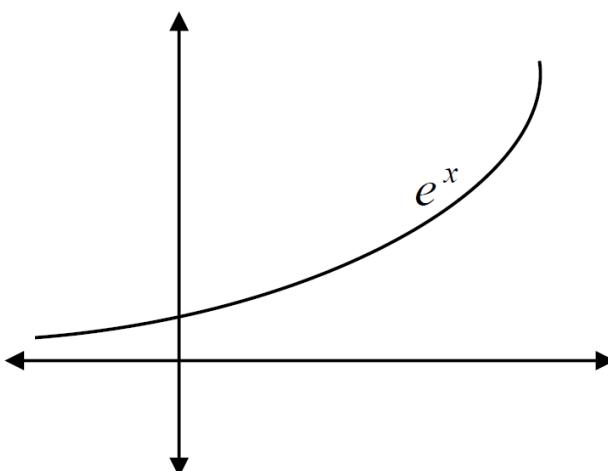

4)  $e^{-a} = \frac{1}{e^a}$

5)  $e^{ab} = (e^a)^b$

6)  $e^m \ln a = a^m$

7)  $e^{\ln x^2} = x^2$

8) **The graph of  $y = e^x$  is:**

## The Derivative of $y = e^x$

In general form:

$$\frac{d}{dx} e^u = e^u \cdot \frac{du}{dx}$$

### Examples:

**Find the  $\dot{y}$  for the following functions**

$$1) y = e^{2x} \Rightarrow \dot{y} = 2 \cdot e^{2x}$$

$$2) y = e^{x^3} \Rightarrow \dot{y} = 3x^2 e^{x^3}$$

$$3) y = e^{\sqrt{1+5x^3}} \Rightarrow \dot{y} = \left(\frac{15x^2}{2\sqrt{1+5x^3}}\right) e^{\sqrt{1+5x^3}}$$

$$4) y = x^2 \cdot e^x \Rightarrow \dot{y} = x^2 \cdot e^x + e^x(2x)$$

$$5) y = e^{\sin^{-1}(x)} \Rightarrow \dot{y} = \frac{e^{\sin^{-1}(x)}}{\sqrt{1-x^2}}, \quad \frac{d}{dx} \sin^{-1}(x) = \frac{1}{\sqrt{1-x^2}}$$

$$6) y = e^x \cdot \ln x \Rightarrow \dot{y} = e^x \cdot \frac{1}{x} + \ln x \cdot e^x \cdot 1 \\ = e^x \left( \frac{1}{x} + \ln x \right) = e^x \frac{(1+x \ln x)}{x}$$

$$7) e^{2x} = \sin(x + 3y)$$

$$e^{2x} \cdot 2 = \cos(x + 3y) \cdot (1 + 3\dot{y})$$

$$1 + 3\dot{y} = \frac{2e^{2x}}{\cos(x+3y)}$$

$$\dot{y} = \frac{2e^{2x}}{3 \cos(x+3y)} - \frac{1}{3}$$

# **The Exponential Function with Base Other Than a**

**Definition:** If  $a$  is any number which is positive, and  $x$  is any real number, the function  $f$  defined by  $f(x) = a^x = e^{x \ln a}$ ,  $a$  is any constant, is called **the exponential function to base a**.

For example:  $3^{x^4}$ ,  $7^{x^2}$ ,  $10^{\ln x}$

## **The Derivative of $y = a^x$**

$$\frac{d}{dx} a^u = a^u \cdot \ln a \cdot \frac{du}{dx}$$

**Examples:** Find  $\frac{dy}{dx}$  to:

1)  $y = 7^{x^2}$

$$\begin{aligned}y' &= 7^{x^2} (\ln 7)(2x) \\&= (\ln 7)(2x) 7^{x^2}\end{aligned}$$

2)  $y = 3^{\tan(x)}$

$$y' = 3^{\tan(x)} (\ln 3) (\sec^2(x))$$

3)  $y = 2^{\sec(x)}$

$$\begin{aligned}y' &= 2^{\sec(x)} (\ln 2) (\sec(x) \tan(x)) \\&\Rightarrow (\ln 2) \sec(x) \tan(x) \cdot 2^{\sec(x)}\end{aligned}$$

## EIGHTH LECTURE

# Application of Derivative

## Drawing of curves

لرسم الشكل العام لأي منحنى بطريقة استخدام التفاضلات نتبع الخطوات التالية:

(1) اوسع مجال الدالة اذا كانت :

(a) دالة اعتيادية (متعددة حدود) اوسع مجال لها هو  $R$

(b) دالة كسرية (في مقامها متغير) اوسع مجال لها هو  $R$  ما عدا القيم التي تجل المقام صفر.

(2) ايجاد نقاط التقاطع المحورين وذلك

(a) مع محور السينات  $x$  وذلك بوضع  $y = 0$  في الدالة الاصلية ونجد  $x$ .

(b) مع محور الصادات  $y$  وذلك بوضع  $x = 0$  في الدالة الاصلية ونجد  $y$ .

(3) التناظر (Symmetry) ويكون حول:

(a) حول المحور الصادات  $y$  : عندما نعوض  $x$  - بدلا من  $x$  في الدالة الاصلية تبقى كما هي

عبارة اخرى ( اذا كانت جميع اسس  $x$  زوجية فقط فالدالة متناظرة حول محور الصادات )

$$f(-x) = f(x)$$

(b) حول نقطة الاصل: عندما نعوض  $x$  - بدلا من  $x$  في الدالة الاصلية تتغير اشارتها فقط

عبارة اخرى ( اذا كانت جميع اسس  $x$  فردية فقط فالدالة متناظرة حول نقطة الاصل )

$$f(-x) = -f(x)$$

**ملاحظة:** اذا كانت اسس  $x$  زوجية وفردية فإنه لا يوجد تناظر.

(4) المحاذيات ( يخص الدوال الكسرية فقط ) وتكون:

(a) المحاذي العمودي معادلته  $x=c$  حيث  $c$  كمية ثابتة.

(b) المحاذي الافقى معادلته  $y=c$  حيث  $c$  كمية ثابتة.

لأيجاد معادلة اي محاذى نساوي المقام تلك الدالة للصفر ثم نجد قيم المجهول بحل تلك المعادلة الناتجة

فتمثل معادلة المحاذى.

**ملاحظة:** يمكن ايجاد معادلة المحاذى الافقى

$$y = \frac{\text{معامل } x^2 \text{ في البسط}}{\text{معامل } x^2 \text{ في المقام}} \text{ او } \frac{\text{معامل } x \text{ في البسط}}{\text{معامل } x \text{ في المقام}} = \dots$$

(اس  $x$  في البسط = اس  $x$  في المقام والقياس لا على اس)

(5) النقطة الحرجة وانواعها ومناطق التزايد والتناقص وذلك:

بوضع المشتق الاولى مساوية لصفر حيث  $\dot{f}(x) = 0$

وتكون :

(a) نقطة نهاية عظمة محلية وتتغير اشارتها من + + الى ( - - الاختبار من اليسار الى اليمين).

(b) نقطة نهاية صغرى محلية وتتغير اشارتها من - - الى + + (الاختبار من اليسار الى اليمين).

(c) مجرد نقطة حرجة اي لا تتغير اشارتها.

**ملاحظة:**

- اذا كانت  $\dot{f}(x) > 0$  فان  $y$  متزايدة
- اذا كانت  $\dot{f}(x) < 0$  فان  $y$  متناقصة.
- الاتجاه من اليمين اكبر من {العدد  $> x$ :  $x$ }
- الاتجاه من اليسار اصغر من {العدد  $< x$ :  $x$ }
- والمنطقة المحددة بين عددين تقرأ بشكل فتره فتوحة (العدد الكبير, العدد الصغير)

**طريقة ايجاد النهايات ومناطق التزايد والتناقص للدالة:**

(1) نجد  $\dot{f}(x) = 0$

(2) نجد المعادلة الناتجة ونجد قيم  $x$ .

(3) نضع قيم  $x$  على الاعداد (يسمى خط اشارة  $\bar{x}$  وهو محور السينات)

(4) نختار قيم اكبر من  $\bar{x}$  واصغر من  $\bar{x}$  (جوارات  $x$ ) ونعرضها في ( $y$ ) لمعرفة اشارة  $\bar{y}$ .

(5) نحدد مناطق التزايد والتناقص.

(6) نحدد العظمى او الصغرى حسب نوع تغير اشارة  $\bar{y}$  لانسى الاختبار من اليسار لليمين

(7) نعرض قيم  $x$  بالدالة الاصلية  $f(x) = y$  فنحصل على قيم  $y$  المناظرة لقيم  $x$

ف تكون  $(x, y)$  هي النهاية العظمة او الصغرى او مجرد حرجة.

(6) **نقطة الانقلاب**

هي نقطة تتنمي للدالة وعندما  $0 = \bar{y}$  وتتغير اشارة  $\bar{y}$  من + الى - او بالعكس. في الدوال المستمرة

تكون نقطة الانقلاب بين كل عظمى وصغرى او بالعكس, او كل نقطة مجرد حرجة هي نقطة انقلاب.

**ملاحظة:** اذا كانت  $0 > \hat{y}$  (موجبة) فان  $y$  مقعرة.

اذا كانت  $0 < \hat{y}$  (سالبة) فان  $y$  محدبة.

طريقة ايجاد نقاط الانقلاب ومناطق التحدب والتقرّع.

1) نجد  $\hat{y}$  ثم  $0 = \hat{y}$

2) نحل المعادلة الناتجة ونجد قيم  $x$  ونضعها على خط الاعداد ( اشارة خط  $\hat{y}$  )

3) نختار قيم اكبر من  $x$  واصغر من  $x$  (جوارات  $x$ ) ونعرضها في ( $\hat{y}$ ) لمعرفة اشارة  $\hat{y}$ .

4) نحدد مناطق الحدب (---) ومناطق التقرّع (+++).

5) ثُمّرر نقطة الانقلاب من تغير الاشارة حولها, ولا توجد انقلاب في حالة عدم تغيير الاشارة.

6) نعرض قيم  $x$  بالدالة الاصليه  $f(x) = y$  فنحصل على قيم  $y$  المناظرة لقيم  $x$   
ف تكون  $(x, y)$  هي نقطة الانقلاب

## Examples:

Draw the following function by using differentiation

1)  $f(x) = x^5$

**Solution:**

1. Since  $f(x)$  is polynomial function the domain=  $R$

2. **The intersection points are:**

Set  $x = 0 \Rightarrow y = 0^5 = 0 \dots (1)$

$y = 0 \Rightarrow x^5 = 0 \Rightarrow x = 0 \dots (2)$

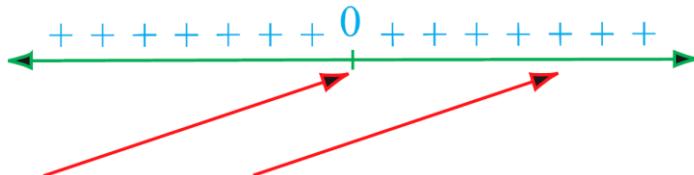

Then the intersection point is  $(0,0)$

3. **Symmetry:** There is symmetry about the origin  $(0, 0)$  because the exponents of  $x$  **are odd**.

4. **Asymptotes:**  $f(x)$  has no asymptotes. Because  $f(x)$  is not rational function

5. **Maximum and Minimum:**

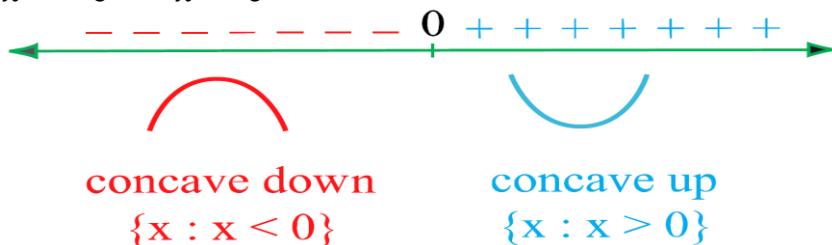

$$\hat{f}(x) = 5x^4 \quad \hat{f}'(x) = 0 \Rightarrow 5x^4 = 0 \Rightarrow x = 0$$

$\{x: x < 0\}, \{x: x > 0\}$  increasing  $f(x)$

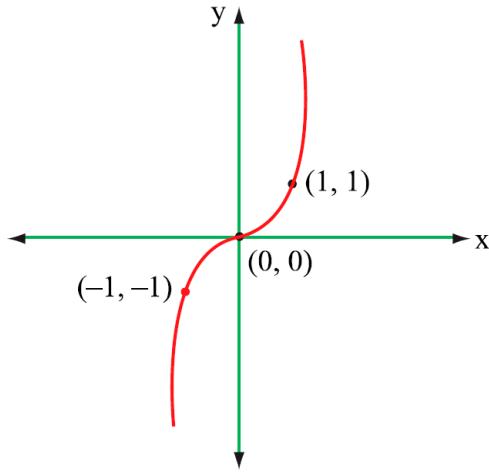

The point  $(0,0)$  is critical point

6.  $\hat{f}'(x) = 20x^3 = 0 \Rightarrow x = 0$

The point  $(0,0)$  is inflection point.

$x$	-2	-1	0	1	2
$y$	-32	-1	0	1	32

2)  $y = f(x) = x^3 - 3x^2 + 4$

**Solution:**

1. Since  $f(x)$  is polynomials function the domain=  $R$

2. **The intersection points are:**

Set  $x = 0 \Rightarrow y = 0^3 - 3(0)^2 + 4 = 4$

$y = 0 \Rightarrow x^3 - 3x^2 + 4 = 0 \Rightarrow x^2(x - 3) = -4$

$x^2 = -4 \Rightarrow x = 2 \text{ or } x - 3 = -4 \Rightarrow x = -1$

Then the intersection points are  $(0, 4), (2, 0), (-1, 0)$

3. **Symmetry:**  $f(x)$  is not symmetry. Because the exponents of  $x$  **neither even nor odd.**

4. **Asymptotes:**  $f(x)$  has no asymptotes. Because  $f(x)$  is not rational function.

5. **Maximum and Minimum:**

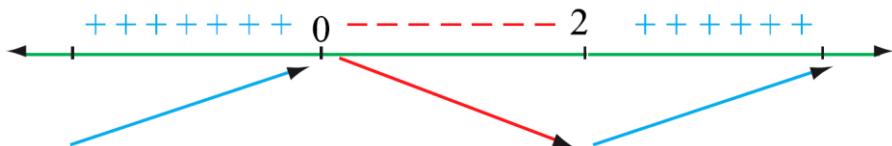

$$f'(x) = 3x^2 - 6x = 0 \Rightarrow x(3x - 6) = 0$$

$$\Rightarrow x = 0 \text{ or } 3x - 6 = 0 \Rightarrow x = 2$$

If  $x = 0$  then  $f(0) = 4$

If  $x = 2$  then  $f(2) = 0$

نعرض قيم  $x$  في الدالة الاصلية

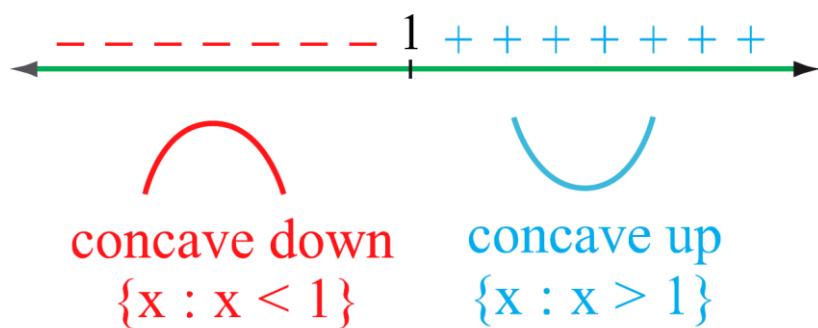

$f(x)$  is increasing on  $\{x : x < 0\}, \{x : x > 2\}$

$f(x)$  is decreasing on  $(0, 2)$

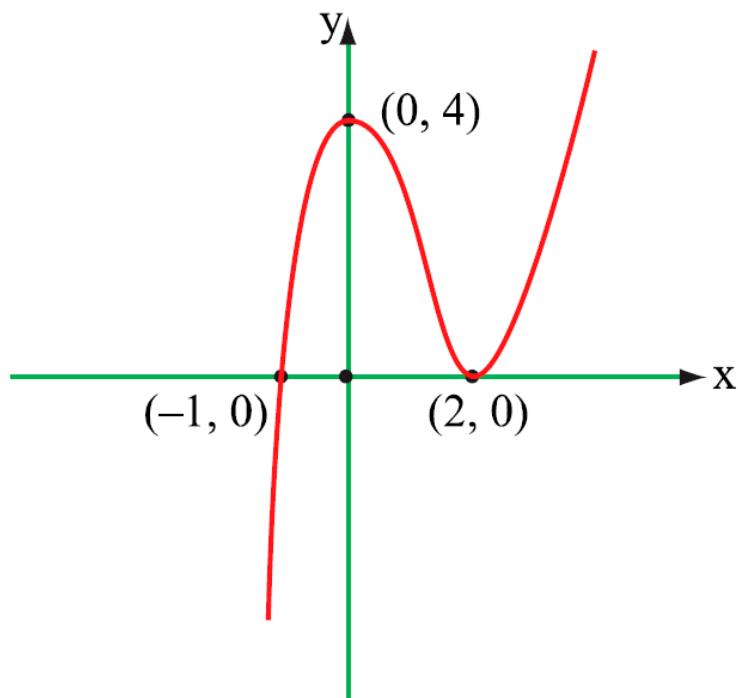

$$6. \quad \hat{f}(x) = 6x - 6 = 0 \Rightarrow x = 1$$

$$f(1) = 2$$

$(1, 2)$  is inflection point.

$x$	-1	0	1	2	3
$y$	0	4	2	0	4

3)  $y = \frac{3x-1}{x+1}$

**Solution:**

- Denominator cannot be 0.  $x + 1 = 0 \Rightarrow x = -1$

Domain =  $R/\{-1\}$

- Since 1 belongs to domain of  $f$  but  $(-1)$  doesn't belong to domain of  $f$ . then the curve is not symmetric to  $y$  axis and not symmetric to origin point.

- $x = 0 \Rightarrow y = -1 \Rightarrow (0,1) \rightarrow y$  -intercept.

$$y = 0 \Rightarrow x = \frac{1}{3} \Rightarrow \left(\frac{1}{3}, 0\right) \rightarrow x$$
 -intercept.

- $x + 1 = 0 \Rightarrow x = -1$  (Vertical asymptote)

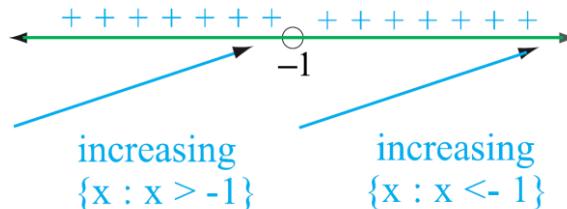

$$\frac{3x-1}{1x+1} = \frac{3}{1} = 3 \text{ (Horizontal asymptote)}$$

- $\hat{y} = \frac{(x+1)(3) - (3x-1)(1)}{(x+1)^2} = \frac{3x+3-3x+1}{(x+1)^2} = \frac{4}{(x+1)^2}$

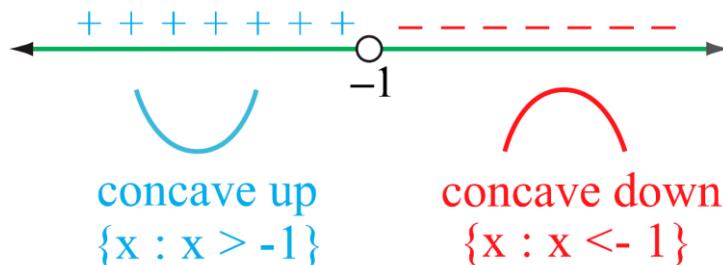

$$\forall x \in R/\{-1\}, \hat{f}(x) > 0$$

So  $f$  is increasing on  $\{x : x < -1\}, \{x : x > -1\}$

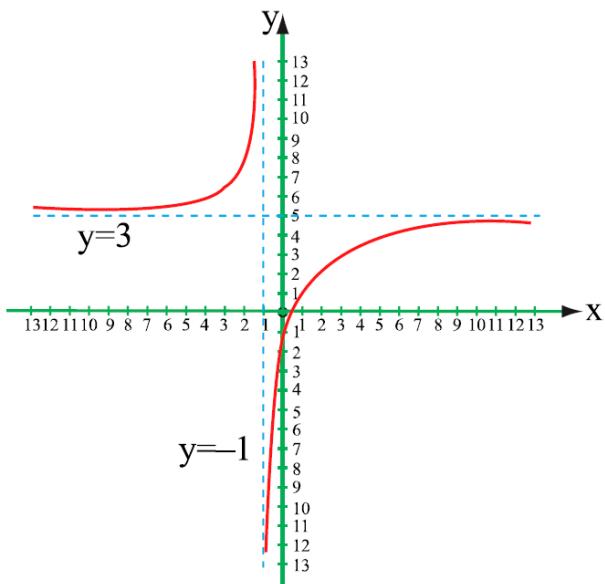

نجد الممتد الأفقي من خلال  
معامل  $x$  في البسط  
 $y = \frac{\text{معامل } x \text{ في البسط}}{\text{معامل } x \text{ في المقام}}$

- $\ddot{y} = \frac{-8}{(x+1)^3} \neq 0$

Function has no inflection point because  $(-1)$  doesn't belong to domain of  $f$ .

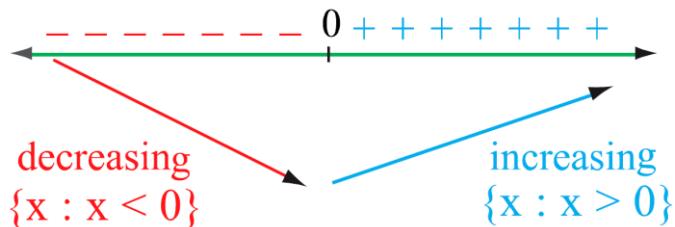

4)  $y = \frac{x^2}{x^2+1}$

**Solution:**

1. Domain of  $f = R$ .
2.  $x = 0 \Rightarrow y = 0 \quad \therefore (0,0)$  is x-y- intercepts.
3. There is symmetry about the  $y - axis$  because the exponents of  $x$  are even.
4.  $x^2 + 1$  is always different from 0. Then there is no vertical asymptote.

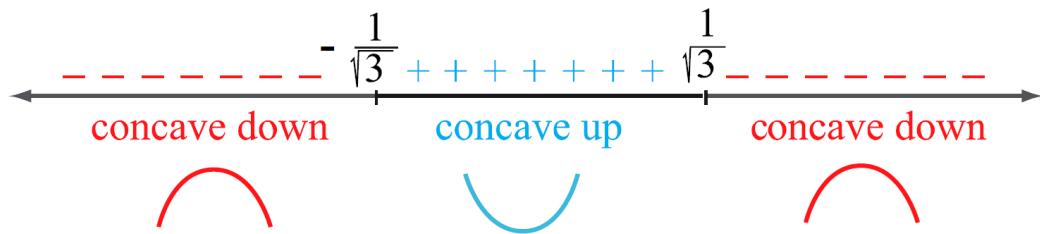

$$y = \frac{x^2}{x^2+1} = \frac{1}{1+1/x^2}$$

$$5. \dot{y} = \frac{(x^2+1)(2x) - x^2(2x)}{(x^2+1)^2} = \frac{2x}{(x^2+1)^2} \Rightarrow x = 0 \Rightarrow f(0) = 0 \Rightarrow (0,0)$$

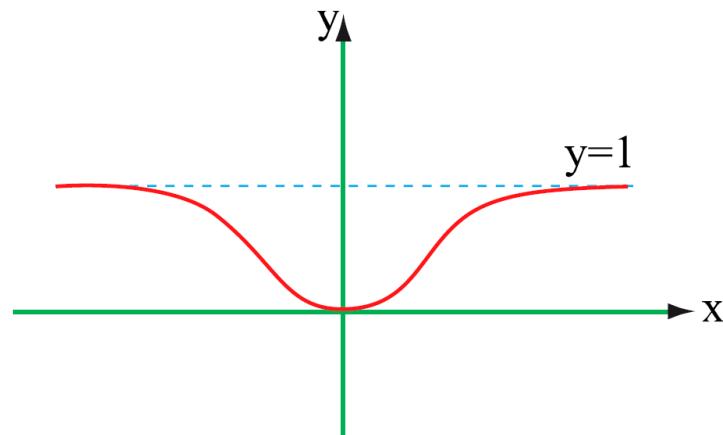

(0,0) is a turning point

$$6. \ddot{y} = \frac{(x^2+1)^2 \cdot 2 - 2x(x^2+1)2x}{(x^2+1)^4} = \frac{2-6x^2}{(x^2+1)^3} = 0 \Rightarrow x = \pm \frac{1}{\sqrt{3}}$$

$f(x)$  is concave down  $\left\{x: x < -\frac{1}{\sqrt{3}}\right\}, \left\{x: x > \frac{1}{\sqrt{3}}\right\}$

$f(x)$  is concave up  $(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}})$

$f\left(\pm\frac{1}{\sqrt{3}}\right) = \frac{1}{4} \Rightarrow \left(\frac{1}{\sqrt{3}}, \frac{1}{4}\right), \left(-\frac{1}{\sqrt{3}}, \frac{1}{4}\right)$ . Are inflection points.

## NINTH LECTURE

# ***Optimization (Maximum, Minimum) Problems***

By using differential calculus, we can solve many problems that call for minimizing or maximizing a function to get **maximum area**, **minimum velocity**, ... etc.

لحل مثل هذه المسائل نتبع الخطوات الآتية:

- (1) نرسم شكلاً توضيحاً للمسألة نعين عليه معاليم المسالة ونفرض عليه مجاهيل المسالة.
- (2) نكون الدالة التي تقع عليها كلمة أكبر ممكناً أو أصغر ممكناً ونشتق عذراً الدالة إن كانت بمتغير واحد.
- (3) إذا كانت الدالة بمتغيرين أو أكثر نجد علاقة من بين المتغيرات ونوحد المتغيرات ونجعلها متغير واحد.
- (4) نساوي المشتق للصفر ونجد قيم المجاهيل.

### Examples:

**1) Find two numbers whose product is as large as possible and their sum=20.**

#### **solution**

First number =  $x$

second number =  $y$

The product  $A = x \cdot y$

The sum  $x + y = 20$

$$\Rightarrow y = 20 - x$$

$$\therefore A = x \cdot (20 - x)$$

$$A = 20x - x^2$$

$$\frac{dA}{dx} = 20 - 2x = 0$$

$$\Rightarrow x = 10$$

$$\Rightarrow y = 20 - 10 = 10$$

**2) Find maximum rectangle that can be inscribed between the curve  $y = 4 - x^2$  and the  $x$ -axis and it's vertices lie on the curve and it's base on the  $x$ -axis.**

#### **solution**

$$y = 4 - x^2$$

When

$$y = 0 \Rightarrow 4 - x^2 = 0$$

$$\Rightarrow x^2 = 4 \Rightarrow x = \pm 2$$

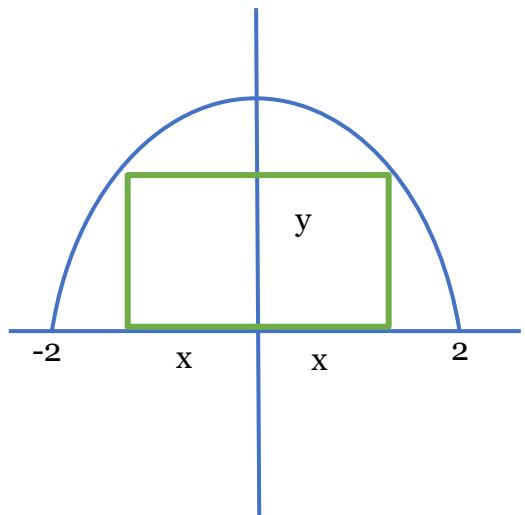

$$\text{Area} = 2xy$$

$$A = 2x \cdot (4 - x^2) \Rightarrow A = 8x - 2x^3$$

$$\frac{dy}{dx} = 8 - 6x^2 = 0$$

$$\Rightarrow 8 = 6x^2 \Rightarrow x^2 = \frac{8}{6} = \frac{4}{3}$$

$$x = \pm \frac{2}{\sqrt{3}} \Rightarrow y = 4 - \frac{4}{3} \Rightarrow y = \frac{12-4}{3} = \frac{8}{3}$$

**3) What is the volume of the largest cone that can be inscribed in a sphere with radius  $r$ .**

**Solution**

$$v = \frac{\pi}{3} x^2 \cdot h$$

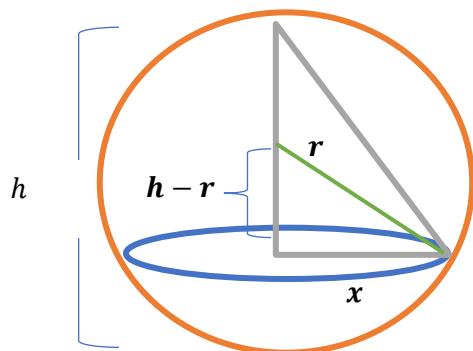

$$v = \frac{\pi}{3} [r^2 - (h-r)^2] \cdot h$$

$$v = \frac{\pi}{3} r^2 h - \frac{\pi}{3} (h-r)^2 \cdot h$$

$$v = \frac{\pi}{3} r^2 h - \frac{\pi}{3} h \cdot (h^2 - 2hr + r^2)$$

$$v = \frac{\pi}{3} r^2 h - \frac{\pi}{3} h^3 + \frac{2\pi}{3} h^2 r - \frac{\pi}{3} r^2 h$$

$$\therefore v = \frac{2\pi}{3} h^2 r - \frac{\pi}{3} h^3$$

$$r^2 = x^2 + (h-r)^2$$

$$x^2 = r^2 - (h-r)^2$$

**4) A square sheet  $50 \times 50$  cm is used to make an open top box by cutting small square area from its corner and bending up. Find maximum volume that can be got from this sheet**

**Solution**

$$v = (50 - 2x)^2 \cdot x$$

$$= (2500 - 200x + 4x^2) \cdot x$$

$$= 2500x - 200x^2 + 4x^3$$

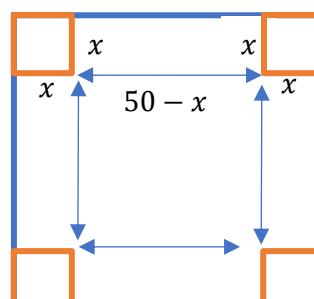

$$\frac{dv}{dx} = 2500 - 400x + 12x^2 \quad \} \div 4$$

$$= 3x^2 - 100x + 625$$

$$(x-25)(3x-25) = 0$$

$$\text{either } x-25 = 0 \rightarrow x = 25$$

$$\text{or } 3x-25 = 0 \rightarrow x = \frac{25}{3}$$

## TENTH LECTURE

### Related Rates (Rate of Change)

المعدلات المرتبطة:

مجموعة من المتغيرات تعتمد على تغير واحد (يسمى باراميتر) حيث العلاقة هي ارتباط. فأن المعدلات الزمنية تسمى بالمعدلات المرتبطة بالزمن.

اذا كان المتغيران  $x, y, s, v$  تابعين كل منهما يرتبط بالمتغير  $t$  (مستقل) فأن:

$$\frac{dy}{dt} = \text{Rate of change of } y \text{ w.r.t. time}$$

$$\frac{dx}{dt} = \text{Rate of change of } x \text{ w.r.t. time}$$

$$\frac{ds}{dt} = \text{Rate of change of distance with time} = \text{velocity} = V$$

$$\frac{dv}{dt} = \text{Rate of change of velocity with time} = \text{acceleration} = \frac{d^2s}{dx^2}$$

حل المسائل بالمعدلات الزمنية تتبع ما يلي:

- 1) نرسم مخطط للمسألة ان امكن ونحدد عليه الثوابت ونفرض عليه المتغيرات بالرموز.
- 2) نحدد العلاقة الرئيسية في حل السؤال مثل الحجم او المساحة او اي علاقة ...
- 3) اذا كان هناك اكثر من متغيرين فنجد علاقة من معلومات السؤال للتخلص من كثرة المتغيرات.
- 4) نعرض معطيات السؤال من المتغيرات ولكن بعد الاشتقاق

**ملاحظة:** عند اشتقاق اي متغير نضربه في  $\frac{d\text{متغير}}{dt} = \text{المعدل}$ , ويمكن معرفة هذه الاسئلة من ذكر جد

المعدل او سرعة او من معطيات المسالة باسم اذا علمت ان المعدل او السرعة ...

### Examples:

**1) How fast does the radius of spherical soap bubble change when a cylindrical tank is drained at a rate of ( 3 Liter/sec).**

#### **Solution**

$$v = \pi r^2 h$$

$$\Rightarrow v = \pi x^2 h \quad s.t. \quad x \text{ is constant}$$

$$\frac{dv}{dt} = \pi x^2 \frac{dh}{dt}$$

$$\frac{dv}{dt} = \frac{dv}{dh} \cdot \frac{dh}{dt}$$

$$3 = \pi x^2 \frac{dh}{dt}$$

$$\frac{dh}{dt} = \frac{3}{\pi x^2}$$

**2) Water runs into the conical tank at the rate (9 ft<sup>3</sup>/min) , How fast the water level rising when the water is (6 ft) deep all dimensions of the tank as shown in figure.**

#### **Solution**

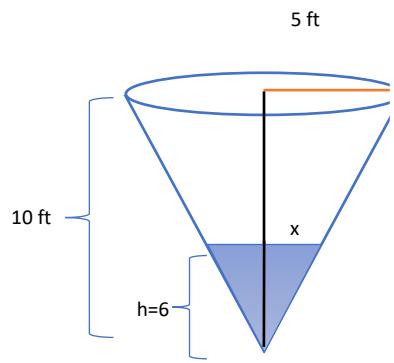

$$v = \frac{\pi}{3} x^2 h \dots \dots (1)$$

$$\frac{5}{10} = \frac{x}{h} \dots \dots (2)$$

$$\Rightarrow x = \frac{h}{2}$$

$$v = \frac{\pi}{3} \left(\frac{h}{2}\right)^2 h = \frac{\pi}{12} h^3 \Rightarrow \frac{dv}{dt} = \frac{\pi 3h^2}{12} \cdot \frac{dh}{dt}$$

$$\therefore \frac{dh}{dt} = \frac{4 \frac{dv}{dt}}{\pi h^2} = \frac{4(9)}{\pi (6)^2} = \frac{1}{\pi} \quad \frac{dv}{dt} = \frac{dv}{dh} \cdot \frac{dh}{dt}$$

**3) A (13 ft) ladder is standing against a wall when it's base starts to slide away. By the time, the base is 12-ft from the wall, the base is moving at the rate of (5 ft/sec):**

**a) How fast the top of the ladder sliding down?**

**b) How fast the area of the triangle formed by the ladder, wall and the ground are change?**

**Solution**

**a)  $13^2 = x^2 + y^2$**

$$x^2 = 13^2 - y^2$$

$$x = \sqrt{169 - y^2}$$

$$12 = \sqrt{169 - y^2}$$

$$144 = 169 - y^2 \Rightarrow y^2 = 169 - 144 = 25 \Rightarrow y = 5 \text{ ft}$$

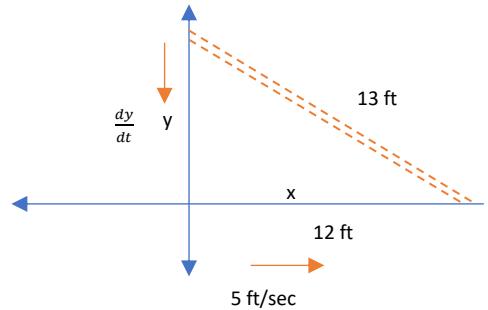

$$0 = 2x \frac{dx}{dt} + 2y \frac{dy}{dt}$$

$$0 = 2(12)(5) + 2(5) \frac{dy}{dt} \Rightarrow \frac{dy}{dt} = \frac{-120}{10} = -12$$

**b)  $A = \frac{x \cdot y}{2}$**

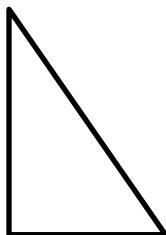

$$\frac{dA}{dt} = \frac{1}{2} \left( x \cdot \frac{dy}{dt} + y \cdot \frac{dx}{dt} \right)$$

$$\frac{dA}{dt} = \frac{1}{2} (12 * (-12) + 5 * (5)) \Rightarrow \frac{dA}{dt} = -59.5 \text{ ft}^2/\text{sec}$$

# ملحق بالقوانين العامة

## قوانين المساحات والجوم للاشكال الهندسية الثانية

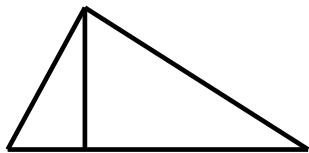

### المثلث القائم الزاوية

$$z^2 = x^2 + y^2 \quad \text{مبرهن فيثاغورس}$$

$$\sin \theta = \frac{\text{المقابل}}{\text{الوتر}} = \frac{y}{z}, \cos \theta = \frac{\text{المجاور}}{\text{الوتر}} = \frac{x}{z}, \tan \theta = \frac{\text{المقابل}}{\text{المجاور}} = \frac{y}{x}$$

**المساحة** = حاصل ضرب ضلعيه القائمين  $A = \frac{1}{2}xy$

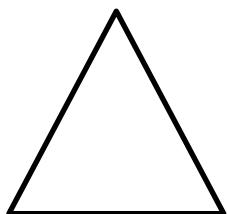

**المحيط** = مجموع اطوال اضلاعه الثلاثة  $P = x + y + z$

### المثلث الاعتيادي

**المساحة** = نصف القاعدة  $\times$  الارتفاع  $A = \frac{1}{2}xh$

**المحيط** = مجموع اطوال اضلاعه الثلاثة  $P = x + y + z$

### المثلث المتساوی الاضلاع

**المساحة** =  $\frac{\sqrt{3}}{4} x^2$  ←  $\frac{\sqrt{3}}{4} * (\text{طول الصلع})^2$

**المحيط** = (مجموع اطوال اضلاعه الثلاثة)  $P = 3x$

### المربع

**المساحة** = (طول الصلع) $^2$   $A = x^2$

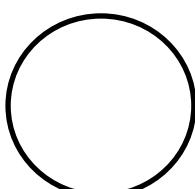

**المحيط** = طول الصلع  $\times$  4  $P = 4x$
