Abstract

This study has been conducted to measure the incidence of breast cancer in Ninawah governorate for patients who presented to AL-Khansa hospital from Sept. 2017 to February 2019.

One hundred eighty-two patients with different breast disease has been collected, 133 patients (73%) were benign and 49 (27%) were malignant. The benign cases were excluded from our study and concentrated on breast cancer case only.

Forty-seven patient (95%) out of (49) malignant patient were female and 2(5%) were male.

Fifteen patients (31%) were in the age group (40-49 year) which reflect the most predominant age group.

Thirty-eight patient (78%) were unmarried and 11 (22%) were married.

Invasive duct carcinoma was the most predominant breast cancer type which was diagnosed in 42 patients (86%).
