Abstract

A descriptive study has been conducted in the intensive care unit in Ibn-Senna Teaching Hospital in Mosul city to assess knowledge and practice of nurses in medication error.

The sample of study consisted of 15 nurses working intensive care unit in the hospital above from the 25th of January 2020 to 28 of March 2020

The data was collected by using knowledge assessment and practice measurement tool. The knowledge assessment tool consisted of 10 items practice Measurement to consist of 10 items. The validity and reliability of the tools of the study have been done through a pilot study and through exposing the tools of the study to 10 experts in different specialties.

The result of the study show that high percentage (about 73%) of the staff who work in intensive care unit are of young age group. It has also been found that the ratio of 61% of male workers is higher than female workers in such unit.

Highly significant differences have been found by measuring the average of knowledge, practice in general with theoretical mean.

The study shows that there are significant differences (<0.001 at p. value) in knowledge, practice and variable of age, sex of nurses significant
