## Abstract

**Background:** Pressure ulcers are the common conditions among patients hospitalized in acute and chronic care facilities and impose significant burden on patients, their relatives and caregivers. Pressure ulcers have been described as one of the most costly and physically debilitating complications since the 20<sup>th</sup> century. The pain and discomfort due to pressure ulcer prolongs illness, rehabilitation, time of discharge and even contribute to disability and death.

The aim of This study to identify the knowledge of nurses about nursing care provided to patients with chest tube, sample of the study was 100 nurses (57) males and (43) female workers in health institutions in the province of Ninevehin, aljumphory teaching hospital for the period from 1/12/2021 to 1/3/2022, was adopted to identify information to collect data after it has been presented and judged by a group of experts,

the study showed that there is a relationship between nurses and knowledge age, where it was the biggest proportion of the age group (30-39) and by 30.% noted Knowledge was the best male, as there was a clear impact of the training courses to raise the level of knowledge of nurses

the study recommends increasing the number of nurses and increase training courses for nursing staff.
